Preeminent control performance and easy operation feature of EtherCAT improve the production efficiency.

The EtherCAT communications with 100Mbps baud rate enables fast and accurate position control.
A wide range of position control functions are available with this position control unit.

EtherCAT® is a registered trademark of Beckhoff Automation GmbH.

CJ1W-NC881　　**CJ1W-NC882**

Features

- Fast positioning operation: taking from 0.15 to 0.4ms (min.) to start servo operation from PLC start command.
- Support for Servomotors with Absolute Encoders
- Monitor the Deviation between Axes during Linear Interpolation
- A Wide Range of Positioning Operations
- Comes with Memory Operation function.
- Common control interface with pulse-train type position control unit (CJ1W-NC□□4).
- Fast communication of EtherCAT (250μs min. communications cycle).
- In addition to servo control, inverters, vision sensors, and other I/O devices that support EtherCAT can be connected.
- Support for Servomotors Speed Control and Torque limit outputs.

System Configuration

Note: The connectable EtherCAT slaves for this Position Control Unit are limited. With the EtherCAT slaves which are not supported, it is impossible to configure and establish the EtherCAT communication of this Position Control Unit. Contact us for information of EtherCAT slaves which are connectable with this Position Control Unit.

Ordering Information

International Standards
- The standards are abbreviated as follows: U: UL, U1: UL(Class I Division 2 Products for Hazardous Locations), C: CSA, UC: cULus, UC1: cULus (Class I Division 2 Products for Hazardous Locations), CU: cUL, N: NK, L: Lloyd, and CE: EC Directives.
- Contact your OMRON representative for further details and applicable conditions for these standards.

Position Control Units with EtherCAT interface

| Unit type | Product Name | Specifications | | No. of unit numbers allocated | Current consumption (A) | | Model | Standards |
		Control output interface	No. of axes		5 V	24 V		
CJ1 CPU Bus Units	Position Control Units with EtherCAT interface	Control commands executed by EtherCAT communications. Positioning functions: Memory operation, Direct operation by ladder programming	2 axes	1	0.46	–	CJ1W-NC281	UC1, CE
			4 axes				CJ1W-NC481	
			8 axes				CJ1W-NC881	
			16 axes				CJ1W-NCF81	
		Control commands executed by EtherCAT communications. Positioning functions: Memory operation, Direct operation by ladder programming I/O communications: 64 nodes	4 axes	1	0.46	–	CJ1W-NC482	
			8 axes				CJ1W-NC882	
			16 axes				CJ1W-NCF82	

Note: 1. There is no accessory for the CJ-series Position Control Unit with EtherCAT interface.
2. This unit cannot be used, with the Machine Automation Controller NJ-series.

Recommended EtherCAT Communications Cables
Category 5 or higher (100BASE-TX) straight cable with double shielding (aluminum tape and braided shielding) is recommended.

Cabel with Connectors
Wire Gauge and Number of Pairs: AWG22, 2-pair Cable

Item	Appearance	Recommended manufacturer	Cable length(m)	Model
Cable with Connectors on Both Ends (RJ45/RJ45)		OMRON	0.3	XS5W-T421-AMD-K
			0.5	XS5W-T421-BMD-K
			1	XS5W-T421-CMD-K
Cable with Connectors on Both Ends (M12/RJ45)		OMRON	2	XS5W-T421-DMC-K
			5	XS5W-T421-GMC-K
			10	XS5W-T421-JMC-K

Note: The cable length 0.3, 0.5, 1, 2, 3, 5, 10 and 15m are available. For details, refer to Cat.No.G019.

Cables / Connectors
Wire Gauge and Number of Pairs: AWG24, 4-pair Cable

Item	Appearance	Recommended manufacturer	Model
Cables	–	Tonichi Kyosan Cable, Ltd.	NETSTAR-C5E SAB 0.5 × 4P

Item	Appearance	Recommended manufacturer	Model
Cables	–	Kuramo Electric Co.	KETH-PSB-OMR *
RJ45 Assembly Connector		OMRON	XS6G-T421-1 *

* We recommend you to use above cable and connector together.

Support Software

| Product name | Specifications | | | Model | Standards |
		Number of licenses	Media		
FA Integrated Tool Package CX-One Ver. 4.□	The CX-One is a comprehensive software package that integrates Support Software for OMRON PLCs and components. CX-One runs on the following OS. OS: Windows XP (Service Pack 3 or higher), Vista or 7 Note: Except for Windows XP 64-bit version. CX-One Version 4.□ includes CX-Programmer Ver.9.□. For details, refer to the CX-One catalog (Cat. No. R134).	1 license *1	DVD *2	CXONE-AL01D-V4	–

*1. Multi licenses are available for the CX-One (3, 10, 30 or 50 licenses).
*2. The CX-One is also available on CD (CXONE-AL□□C-V4).

Interpreting Model Numbers

You can identify the number of axes and output pattern from the model number.

CJ1W-NC 2 8 1

(1)　　(2) (3) (4)

No	Item	Symbol	Specifications
(1)	CJ-series Position Control Unit		
(2)	Number of axes	2	2 axes
		4	4 axes
		8	8 axes
		F	16 axes
(3)	Output pattern	8	EtherCAT
(4)	Development number	1	Servo control only
		2	Servo control + I/O communications

Mountable Racks

Model	NJ system		CJ system (CJ1, CJ2)		CP1H system	NSJ system	
	CPU Rack	Expansion Rack	CPU Rack	Expansion Backplane	CP1H PLC	NSJ Controller	Expansion Backplane
CJ1W-NC281 CJ1W-NC481 CJ1W-NC881 CJ1W-NCF81 CJ1W-NC482 CJ1W-NC882 CJ1W-NCF82	Not Supported		16 Units max. (10 per Rack)		Not Supported	Not Supported	10 Units

General Specifications

Item	CJ1W-NC281/-NC481/-NC881/-NCF81/-NC482/-NC882/-NCF82
Dimensions	90 × 65 × 31 mm (H × D × W)
Weight	110 g max.
Internal current consumption	460 mA max. at 5 VDC
Ambient operating temperature	0 to 55°C
Applicable standards	Conforms to cULus and EC Directives.

Note: All other specifications conform to the general specifications of the CJ Series.

Characteristics

Item			Models						
			Servo control only				Servo control + I/O communications

		Direct operation (bits) *9	0.75 to 1.25 ms	1.25 to 2.25 ms	2.5 to 4.5 ms	3.0 to 5.0 ms	1.25 to 2.25 ms	2.5 to 4.5 ms	3.0 to 5.0 ms
		Memory operation (linear interpolation) *9	1.75 to 2.25 ms	3.25 to 4.25 ms	6.5 to 8.5 ms	7.0 to 9.0 ms	3.25 to 4.25 ms	6.5 to 8.5 ms	7.0 to 9.0 ms
Control I/O	Servo Drive interface	Communications port	EtherCAT port × 1						
		Output signals	There are no external output signals for external outputs. The following command bits are provided for each axis for Servo Drive control: Deviation Counter Reset Bit, Alarm Reset Bit, Servo Lock Bit, Servo Unlock Bit, and Torque Limit Bits.						
		Input signals	There are no external input signals for external inputs. The following status flags are provided for each axis for Servo Drive control: Origin Input Flag, Servo Drive Alarm Input Flag, and Positioning Completed Input Flag.						
		External interface signals *10	6 signals (external origin signal, origin proximity signal, forward limit signal, reverse limit signal, emergency stop signal, and interrupt input signal) for each axis						

*1. A controllable Servo Drive is Servo Drive for which you can use the position control functions of the Position Control Unit.
*2. This is the maximum speed command when converted to pulses.
*3. Command units can be set for each axis according to the electronic gear ratio and unit multiplier.
*4. Up to four axes can be controlled by each task.
*5. Setting is possible between -2,147,483,648 and 2,147,483,647 pulses.
*6. The command can be set to up to 104,857,600 pps when converted to pulses.
*7. This is the time from executing a command at the PLC until the command is output on EtherCAT communications.
   Execution for command bits is in the I/O refresh period.
   The starting time depends on the control cycle, communications cycle, and operating conditions.
   Refer to Position Control Units Operation Manual (Cat. No. W487) for details.
*8. The starting time applies when starting one axis with a special Position Control Unit instruction and a CJ2M or CJ2H CPU Unit with unit version 1.3 or later.
*9. These are the internal Position Control Unit processing times.
*10.Servo Drive inputs are used.

OMRON

EtherCAT Communications Specifications

Item	Characteristics						
	Servo control only				Servo control + I/O communications		
	CJ1W-NC281	CJ1W-NC481	CJ1W-NC881	CJ1W-NCF81	CJ1W-NC482	CJ1W-NC882	CJ1W-NCF82
Communications standard	IEC 61158 Type12						
Physical layer	100Base-TX (IEEE802.3)						
Connector	RJ45 shielded connector × 1						
Communications media	Category 5 or higher (Recommended: cable with double, aluminum tape and braided shielding)						
Communications distance	100 m max. between nodes						
Topology	Daisy chain only *1						
EtherCAT Master Specifications	Class B (minimum master-CoE compatible (no information service for SDO))						
Maximum number of slaves *2	2	4	8	16	68	72	80
Node address setting range	1 to 2	1 to 4	1 to 8	1 to 16	1 to 4 and 17 to 80 *3	1 to 8 and 17 to 80 *3	1 to 16 and 17 to 80 *3
Communications cycle *4	250 µs, 500 µs, 1 ms, or 2 ms						
Process data	Fixed PDO mappings specified for the slaves are used (set using Support Software).						
Mail box (CoE)	Emergency messages, SDO requests, SDO responses, and SDO information (Used for Position Control Unit communications control and slave device parameter transfers.)						
LED indicators	ECAT RUN × 1 ECAT ERR × 1 L/A (Link/Activity) × 1						
CiA402 drive profile *5	• Cyclic synchronous position mode • Cyclic synchronous velocity mode • Cyclic synchronous torque mode • Touch probe function • Torque limit function						

*1. Ethernet hubs cannot be used.
*2. This is the number of slaves, including Servo Drives and remote I/O slaves. The number of slaves that can be connected is limited. Refer to *Number of Remote I/O Connections* for details.
*3. Node addresses 17 to 80 are reserved for remote I/O slaves.
*4. The setting range depends on the number of slaves that are connected and the slave specifications.
Refer to Position Control Units Operation Manual (Cat. No. W487) for details.
*5. This drive profile is used when connected to an OMNUC G5-series Servo Drive.

Number of Remote I/O Connections

The Position Control Unit has the memory of up to 640 bytes for inputs and 640 bytes for outputs to be used for PDO communications.
The number of slaves that can be connected to the CJ1W-NC482/NC882/NCF82 is determined by the maximum memory size for PDO communications.
The memory of the PDO communication is shared with the Servo Drives; therefore, the number of I/O slaves that can be connected changes with the number of OMNUC G5 Series Servo Drive (number of use axes) that are connected to the Position Control Unit.

Number of Servo Drive axes	Size used by Servo Drive axes (bytes) *	Remaining PDO communications memory size (bytes)		Number of slaves that can be connected according to slave I/O size (guidelines)			
		IN	OUT	8 bytes of I/O (4 input and 4 output bytes)	16 bytes of I/O (8 input and 8 output bytes)	32 bytes of I/O (16 input and 16 output bytes)	64 bytes of I/O (32 input and 32 output bytes)
0 axis	0	640	640	64	64	40	20
1 axis	29	611	611	64	64	38	19
2 axes	58	582	582	64	64	36	18
4 axes	116	524	524	64	64	32	16
8 axes	232	408	408	64	51	25	12
16 axes	464	176	176	64	22	11	5

* The OMNUC G5-series Servo Drives also use IN and OUT bytes. The factory default of the PDO communications size is 29 bytes.

Functional Specifications

The following functions are supported when the Position Control Unit is connected to an EtherCAT-compatible OMNUC G5-series Servo Drive.

Function			Description
Control functions	Single axis control	Absolute movements	Positioning is performed by specifying the absolute or relative target position and target speed directly from the ladder program.
		Relative movements	
		Speed control	Feeding at a specified speed is performed by specifying the target speed directly from the ladder program. Speed control is implemented using speed feeding with position control.
		Interrupt feeding	Interrupt feeding can be used to move a specified amount when an interrupt input is received during an absolute movement, a relative movement, or speed control.
		Rotation axis control	Rotation axes that are suitable for feeder and index table control can be controlled. Forward and reverse positioning and shortest route operations are possible.
		Changing target positions and target speeds	The target position or target speed can be changed during an absolute movement, a relative movement, or speed control.
	Multi-axis control	Linear interpolation	The operation of more than one axis is started and stopped simultaneously to move in a straight line to the target position from the starting point of each axis. Linear interpolation is possible for up to four axes.
		Circular interpolation	The operation of any two axes is controlled to move in a circular arc. Any of three methods can be used to specify a circular arc: specifying the target position and center point, specifying the target position, radius, and direction and specifying the target position and passing point.
	Memory operation	Automatic continuous operation	The target positions, speeds, and operation patterns can be set in advance in the Position Control Unit to automatically perform a series of operations. Continuous positioning and speed changes are also possible.
		Sequence functions	Memory operation data provides sequence functions, including repetition of a given operation and starting/stopping operation data by using external inputs. Therefore, the Position Control Unit can perform various operation sequences without affecting the ladder programming in the CPU Unit.
Manual operation	Origin searches		External sensors and other means are used to detect the mechanical origin of the system. You can select the origin search operation that is best for your system from 15 different origin search operation patterns.
	Origin returns		You can return to the point that was defined as the mechanical origin.
	Presetting the present position		The present position can be changed to a specified value to define the origin.
	Deceleration stops and emergency stops		An axis that is in operation can be decelerated to a stop or stopped immediately.
	Jogging		You can jog either forward or in reverse.
	Inching		You can inch either forward or in reverse.
Synchronous Data Link			The CJ1W-NC□82 (unit version 1.3 or later) can perform data exchange between the CPU and Position Control Unit at regular intervals when used in conjunction with a CJ2H CPU (unit version 1.4 or later). In addition, you can use this function to perform synchronous feeding position, synchronous feeding velocity, and synchronous feeding torque control. Also, optional commands are available for torque feedforward data, torque limit data, and velocity limitation value.
Auxiliary control functions	Command unit setting		You can set the unit of control for each axis according to the machine.
	Acceleration/ deceleration control	Automatic acceleration/ deceleration control	The acceleration/deceleration curve can be automatically created during operation. You can select either a trapezoidal curve or an S curve based on a tertiary function.
		Changing acceleration/ deceleration rates	You can change the rate of acceleration/deceleration during acceleration/deceleration.
		Switching acceleration/ deceleration points	You can select one of three methods to connect speeds between different operation patterns during continuous memory operation.
	Overrides		You can increase or decrease the operating speed of the system by a specified factor.
	Backlash compensation		You can compensate for mechanical play using a parameter.
	M codes		M codes can be output during memory operation to interlock with external devices.
	Zone settings		You can set zones and assess when the present position is in a zone. Up to three zones can be set for each axis.
	Support for absolute encoders		You can build an absolute positioning system by using a Servomotor with an Absolute Encoder. The Position Control Units can be used together with OMRON's OMNUC G5-series Servomotors with Absolute Encoders.
	Teaching		You can save the present position as position data for memory operation. You can use either the command present position or feedback present position.
	Torque limit outputs		The torque limit outputs can be used to switch the torque limits of the Servo Drive. They can be turned ON and OFF directly from a ladder program. Torque limits can be automatically switched by using holding for an origin search operation. In addition, you can change the torque limit data via the Synchronous Data Link by using the CJ1W-NC□82 (unit version 1.3 or later) in conjunction with a CJ2H-CPU (unit version 1.4 or later) and OMNUC G5-series Servo Drive (version 2.0 or later). Also, you can change the torque limit data via the Memory Area by using the CJ1W-NC□81/ -NC□82 (unit version 1.3 or later) in conjunction with an OMNUC G5-series Servo Drive (version 2.0 or later).
	Monitoring functions	Software limits	You can set forward and reverse software limits for axis operation. If the target position exceeds a software limit, it will be detected in the command value check that is performed at startup.
		Monitoring position/ speed deviations	The Position Control Unit monitors the position or speed deviation between the present command position and present feedback position. You can stop axis operation if the deviation is too large.
		Monitoring deviation between axes	The deviation between axes is also monitored during linear interpolation. You can stop axis operation if the deviation is too large.

		Flickering	Boot error
		ON	PDI WDT timeout
ECAT L/A	Green	OFF	Link not established in physical layer.
		ON	Link established in physical layer.
		Flickering	In operation after establishing link.

EtherCAT Communications Connector

This connector is used to connect the EtherCAT twisted-pair cable.

Connector Specifications

Specification	Description
Electrical characteristics	Conforms to IEEE 802.3 standards.
Connector structure	RJ45 8-pin modular connector (Conforms to ISO 8877.)

Pin Assignments

	Pin No.	Signal name	Abbreviation	Signal direction
	1	Transmission data +	TD+	Output
	2	Transmission data -	TD-	Output
	3	Reception data +	RD+	Input
	4	Not used.	---	---
	5	Not used.	---	---
	6	Reception data -	RD-	Input
	7	Not used.	---	---
	8	Not used.	---	---
	Hood	Frame ground	FG	---

EtherCAT Communications Cables

Use a category 5 or higher cable with double, aluminum tape and braided shielding.

Note: The maximum distance between any two nodes is 100 m. Some cables, however, are not rated for 100 m. Generally speaking, the transmission performance of stranded wires is worse than that of solid wire. Cables with stranded wires generally are not rated for 100 m.

Connector (Modular Plug) Specifications

Use a category 5 or higher, shielded connector.

Note: When selecting a connector, make sure that it is suitable for the cable that you are using. The following items must be confirmed: conductor size, whether connector is solid or stranded wire, whether there are 2 wire pairs or 4, the outside diameter, etc.

Synchronous Data Link function (synchronous feeding torque function) *1 *2	---	---	---

*1. Whether or not this function is supported depends on the version of the OMNUC G5-series Servo Drive.
    For more information, refer to Function Support According to OMNUC G5-series Servo Drive Versions.
*2. Whether or not this function is supported depends on the version of the OMNUC G5-series Servo Drive.
    For more information, refer to Function Support According to CPU Unit Versions.

CJ1W-NC□82   ○: Supported, ---: Not supported

Function	Unit Versions		
	Ver. 1.0	**Ver. 1.1**	**Ver. 1.3**
Status Word Expanded Monitor Type	---	○	○
I/O communications as type of slave that can be connected	---	○	○
Enabling/disabling registered slaves	---	○	○
Clearing input data to zero when there is a communications error with a remote I/O slave	---	○	○
Electronic gear ratio setting range expanded	---	---	○
Origin Position Latch	---	---	○
Ad hoc change of torque limit data by use of Allocated Memory Areas *1	---	---	○
Ad hoc change of torque limit data / torque feedforward data by use of the Synchronous Data Link *1 *2	---	---	○
Synchronous Data Link function (Electric Shaft function) *1 *2	---	---	○
Synchronous Data Link function (synchronous feeding velocity function) *1 *2	---	---	○
Synchronous Data Link function (synchronous feeding torque function) *1 *2	---	---	○

*1. Whether or not this function is supported depends on the version of the OMNUC G5-series Servo Drive.
    For more information, refer to Function Support According to OMNUC G5-series Servo Drive Versions.
*2. Whether or not this function is supported depends on the version of the OMNUC G5-series Servo Drive.
    For more information, refer to Function Support According to CPU Unit Versions.

Function Support According to OMNUC G5-series Servo Drive Versions

As indicated in the table below, functions supported by CJ1W-NC□82 Position Control Units (unit version 1.3 or later) differ depending on the version of the G5 series servo drive used in conjunction with the Position Control Unit:

○: Supported, ---: Not supported

Function		Drive version	
		Ver. 1.□	Ver. 2.0 or later
Synchronous Data Link function (Synchronous feeding functions)	Synchronous Feeding Position (Electric Shaft) function	○	○
	Synchronous Feeding Velocity function	---	○
	Synchronous Feeding Torque function	---	○
Ad hoc change of torque limit data by use of Allocated Memory Areas		---	○
Ad hoc change of torque limit data / torque feedforward data by use of the Synchronous Data Link		---	○

Function Support According to CPU Unit Versions

As indicated in the table below, functions supported by CJ1W-NC□82 Position Control Units (unit version 1.3 or later) differ depending on the version of the CPU unit used in conjunction with the Position Control Unit:

○: Supported, ---: Not supported

Function		CJ2H		CJ1-H/CJ1/ CJ1M/CJ2M
		Ver. 1.3 or earlier	Ver. 1.4 or later	
Synchronous Data Link function (Synchronous feeding functions)	Synchronous Feeding Position (Electric Shaft) function	---	○	---
	Synchronous Feeding Velocity function	---	○	---
	Synchronous Torque Command function	---	○	---
Ad hoc change of torque limit data / torque feedforward data by use of the Synchronous Data Link		---	○	---
