A New Series

Integrated Development Environment Cut Your TCO from Design to Maintenance.

Control from a PLC is made easy by using function blocks.

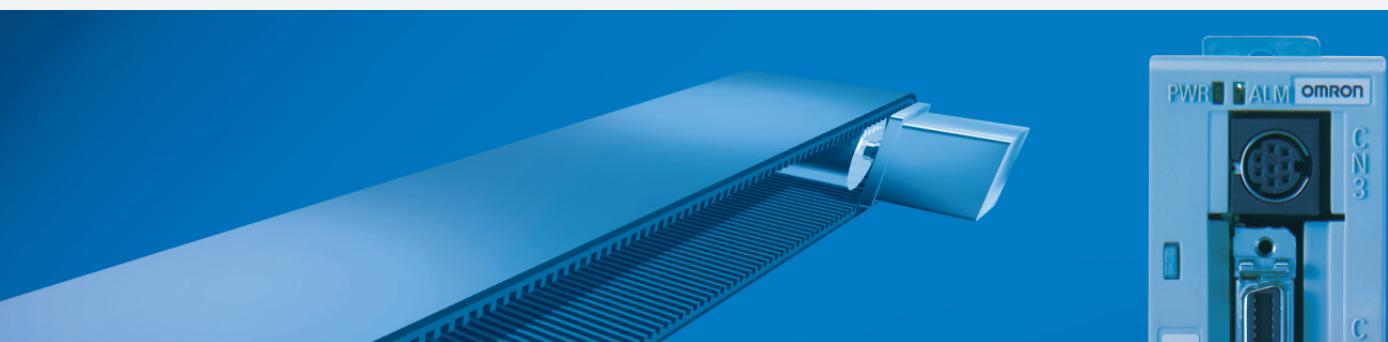

The Servo System can be managed from design to maintenance with the CX-One FA Integrated Package.

Note: CX-Drive (version 1.61) support for SMARTSTEP2 series Servo Drives can be obtained by using the CX-One V2 auto-update function from May 30, 2008.

Easy monitoring of Position Control Unit and Servo Drive errors

Ball Screws, Belt Conveyors, and More: Ideal A Super-compact, High-performance Servo

Compact!

Easy!

Smaller Servo Drives for Multi-axis Applications

Reduce footprint in the control panel.

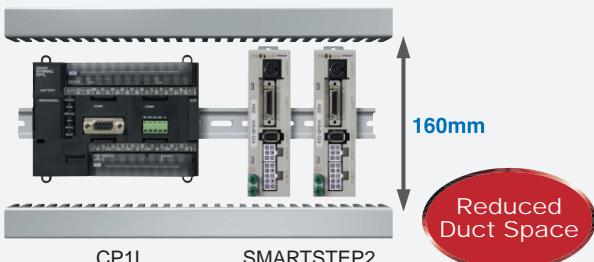

The super-compact SMARTSTEP is now even smaller. The footprint has been reduced by 52%, helping to reduce control panel size.

Downsized Servo Drives for Compact PLCs

Reduce your duct pitch.

SMARTSTEP2 is only 120 mm in height. By mounting it onto the same duct as the compact CP1L PLC, the duct pitch can be reduced, minimizing control panel space.

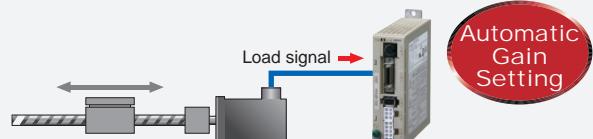

Note: Use the wiring duct and the height max 60mm.
The width between the top and bottom side of the board and the drives is max 100 mm.

Easy Adjustment

Realtime autotuning sets the optimum gain.

An autotuning function calculates the device load in realtime and automatically sets the optimum gain, simplifying the adjustment procedure.

Easier Installation

Mount the Servo to a DIN Rail in one step.

The Servo Drive can be mounted onto a DIN Rail in a single step by using the DIN Rail Mounting Unit (sold separately) for easier assembly and easier maintenance replacements.

Easy Parameter Settings for Mass Production

Use the Parameter Unit as a copy tool.

Parameter can be easily set for many Servo Drives using the Parameter Unit, enabling easier assembly work in mass production lines.

for a Wide Range of Applications System That's Easy to Use

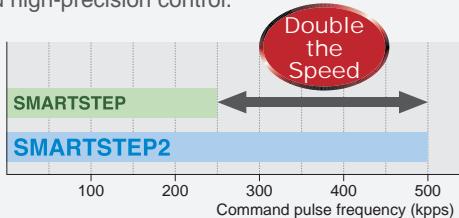

SMARTSTEP2 for Precise Positioning with Ease

Advanced Functionality!

Reduce Tact Time

Achieve high-speed positioning and movement.

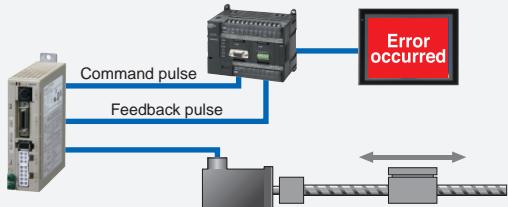

The command pulse frequency at 500 kpps is twice as fast as previous OMRON models, enabling high-speed and high-precision control.

Check the Present Position

Monitor positioning errors with a feedback pulse.

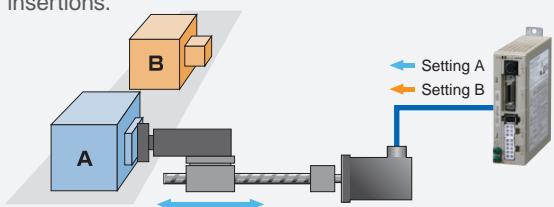

The present position can be checked from the host using the feedback pulse sent from the Servo Drive to the Controller, allowing device errors to be monitored.

Change Pressing Force

Torque limiting function.

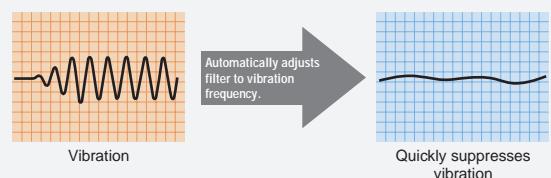

Set two torque limits, and switch between the two limits depending on the application, such as pressing or part insertions.

Reduce Mechanical Vibration

Quick suppression of vibration with an adaptive filter.

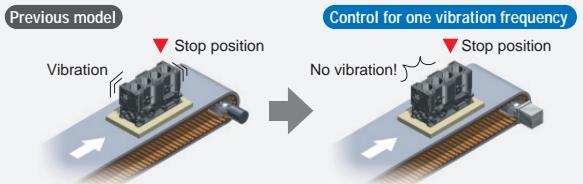

The vibration frequency is automatically measured to remove vibration. Even if the resonant frequency changes, realtime evaluation automatically follows the changes to reduce the effect of vibration due to low mechanical rigidity, such as for conveyor belts.

Reduce Tact Time

High-speed positioning with vibration control.

Mechanical vibration at the stop position caused by low mechanical rigidity can be suppressed by removing the vibration frequency.

The optimum combination can be found from to handle various applications.

Functions

Pulse train	Pulse train: The speed and travel distance are input to the Servo as pulse trains.	Analog: The speed and torque are input to the Servo as analog signals.	ML2: MECHATROLINK-II high-speed Servo communications motion network. (See note.)	Position control: Control is applied to move to the target position and then stop at the target position.	Speed control: Control is applied to change the linear or rotational speed. For example, speed control is used for applications such as turning grindstones, controlling welding speeds, and controlling feeding speeds.
Torque control	Torque control: Control is applied to adjust the rotational force. Torque control is suitable for applications such as parts insertion, pressing, and screw tightening.	Mode switching	Command control mode switching: Switching is possible between any two of the three control modes: position control, speed control, and torque control.	Vibration control	Vibration control function: Vibration is suppressed by automatically setting a filter for the vibration frequency.
FIT GAIN	FIT gain: The rigidity for the realtime autotuning for position control is set automatically. By repeatedly inputting a specific operation pattern, the optimum rigidity is set automatically.	ABS	Absolute output: When the Controller power supply is turned ON, the Controller reads the Servo absolute position data to restore the absolute position.	INC	Incremental output: When the Controller power supply is turned ON, operation is always started from the origin point.
		INC		Adaptive filter: The machine load inertia is calculated in realtime and the result is used to automatically set the optimum gain.	Torque limit

Functions

INC **Incremental/absolute output:** The Servomotor can be switched between an incremental output and an absolute output. When an absolute output is selected and the Controller power supply is turned ON, the Controller reads the Servo absolute position data to restore the absolute position.

INC **Incremental output:** When the Controller power supply is turned ON, operation is always started from the origin point.

AC Servomotors and SMARTSTEP 2-series Servo Drives with Pulse String Inputs

R88M-G/R7D-BP

Advanced Functionality in a Super Compact Design.

- Compact AC Servo Drives

The footprint of the compact AC Servo Drives is only 48% that of the SMARTSTEP A Series, and the volume is only 39%. The AC Servo Drives of the SMARTSTEP 2 Series are also equipped with new functions and higher performance for more accurate positioning.

- Vibration Suppressed during Acceleration/Deceleration of Low-rigidity Mechanisms

Damping control suppresses vibration when using the SMARTSTEP 2 for low-rigidity mechanisms or devices in which the end vibrates.

- Resonance Control for High-speed Positioning

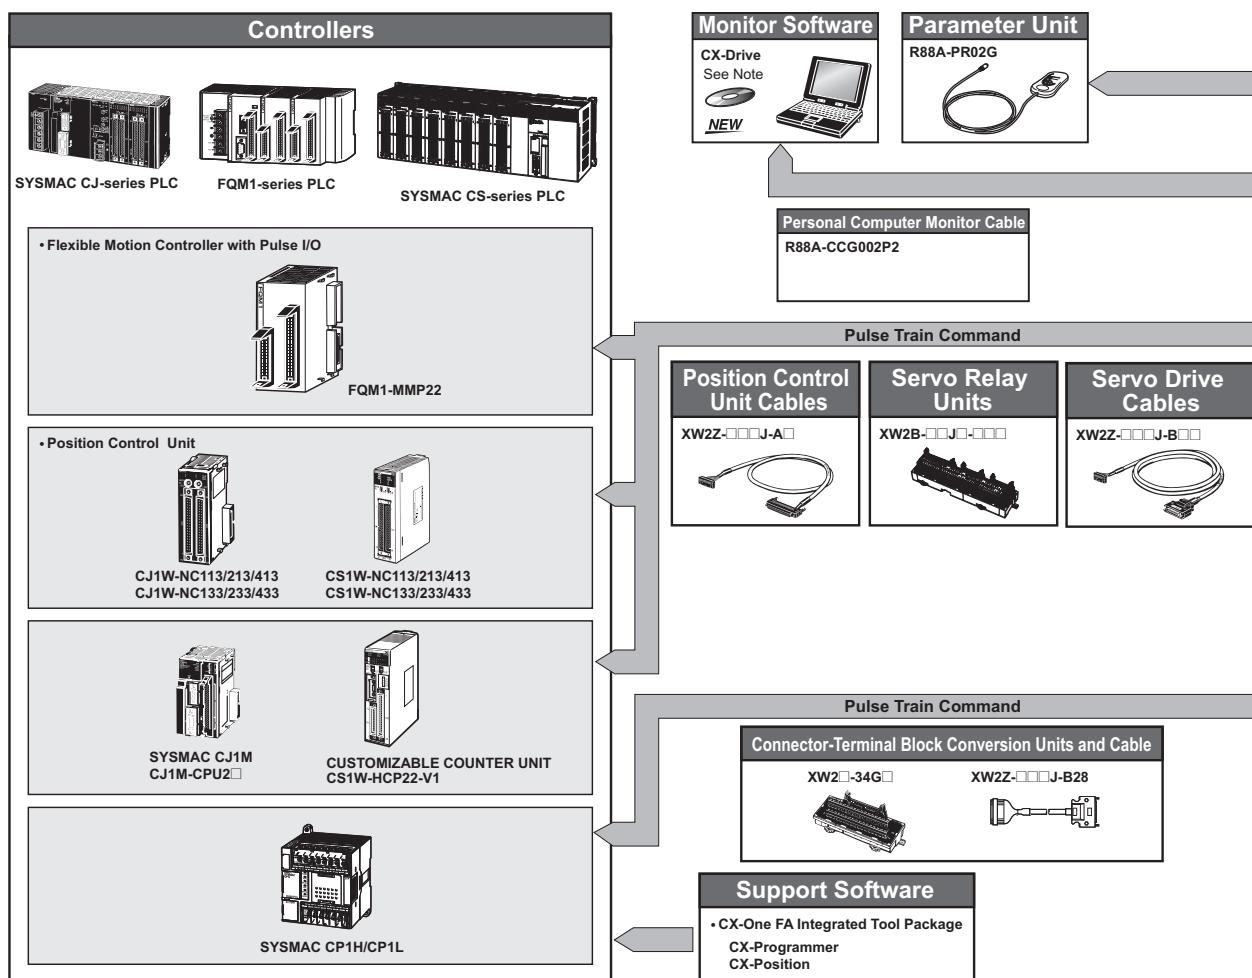

Realtime autotuning estimates the load inertia of the machine in realtime and automatically and constantly sets the optimal gain. The adaptive filter automatically suppresses vibration caused by resonance.

- Compatible with 90° Phase Difference Input Command Pulses

In addition to conventional CW/CCW inputs (2 pulses) and SIGN/PULS inputs (1 pulse), the SMARTSTEP 2 supports 90° phase difference inputs. This makes it possible to input encoder output signals directly into the Servo Drive for simplified synchronization control.

System Configuration

Note: CX-Drive (version 1.61) support for SMARTSTEP2 series Servo Drives can be obtained by using the CX-One V2 auto-update function from May 30, 2008.

- A Wide Range of Pulse Settings

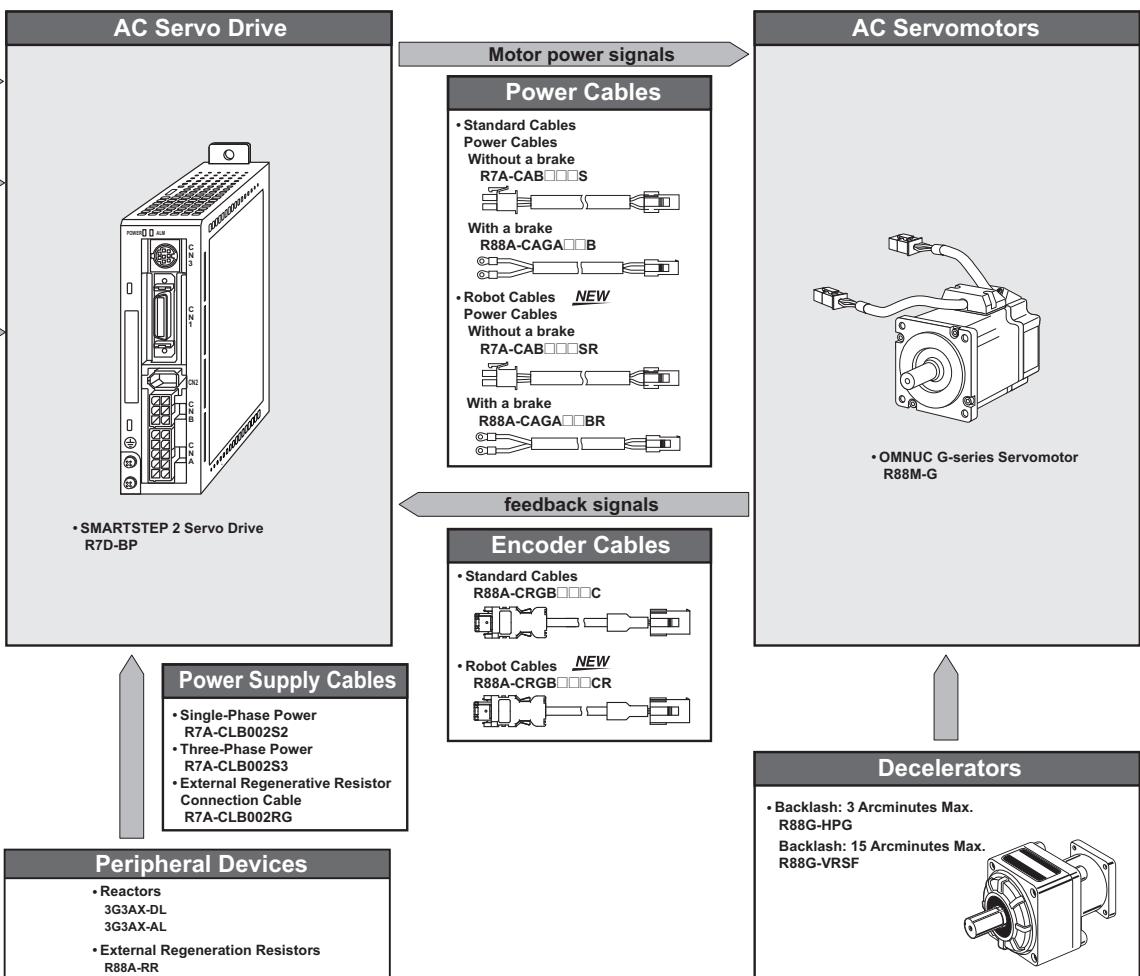

A wide range of pulse settings, such as the command pulse factor, electronic gear, and encoder dividing rate, enable optimal pulse settings for your device or system.

- Simplified Speed Control with Internal Speed Settings

Four internal speed settings allow the speed to be easily switched by using external signals.

- Encoder Output Dividing

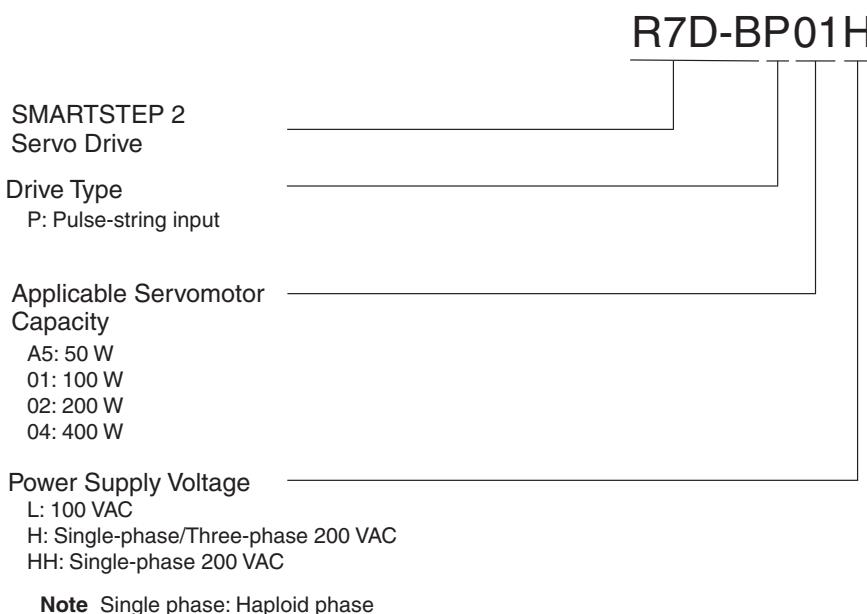

The number of motor encoder pulses output by the Servo Drive can be freely set between 1 and 2,500 pulses per rotation. A parameter can also be set to change the phase.
