# MITSUBISHI SERVO AMPLIFIERS & MOTORS

General-Purpose Interface AC Servo

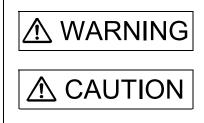

# MR-JE-\_A

SERVO AMPLIFIER INSTRUCTION MANUAL (POSITIONING MODE)

# Safety Instructions

Please read the instructions carefully before using the equipment.

To use the equipment correctly, do not attempt to install, operate, maintain, or inspect the equipment until you have read through this Instruction Manual, Installation guide, and appended documents carefully. Do not use the equipment until you have a full knowledge of the equipment, safety information and instructions. In this Instruction Manual, the safety instruction levels are classified into "WARNING" and "CAUTION".

Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.

Indicates that incorrect handling may cause hazardous conditions, resulting in medium or slight injury to personnel or may cause physical damage.

Note that the A CAUTION level may lead to a serious consequence depending on conditions. Please follow the instructions of both levels because they are important to personnel safety. What must not be done and what must be done are indicated by the following diagrammatic symbols.

Indicates what must not be done. For example, "No Fire" is indicated by 🛞 .

Indicates what must be done. For example, grounding is indicated by

In this Instruction Manual, instructions at a lower level than the above, instructions for other functions, and so on are classified into "POINT".

After reading this Instruction Manual, keep it accessible to the operator.

# 1. To prevent electric shock, note the following.

| ⚠ WARNING   |
|---|
| Before wiring and inspections, turn off the power and wait for 15 minutes or more until the charge lamp turns off. Otherwise, an electric shock may occur. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier. |
| Ground the servo amplifier and servo motor securely.  |
| Any person who is involved in wiring and inspection should be fully competent to do the work.   |
| Do not attempt to wire the servo amplifier and servo motor until they have been installed. Otherwise, it may cause an electric shock.   |
| Do not operate switches with wet hands. Otherwise, it may cause an electric shock.  |
| The cables should not be damaged, stressed, loaded, or pinched. Otherwise, it may cause an electric shock.  |
| ●To prevent an electric shock, always connect the protective earth (PE) terminal (marked ⊕) of the servo amplifier to the protective earth (PE) of the cabinet.   |
| To avoid an electric shock, insulate the connections of the power supply terminals.   |

# 2. To prevent fire, note the following.

# ▲ CAUTION

- Install the servo amplifier, servo motor, and regenerative resistor on incombustible material. Installing them directly or close to combustibles will lead to smoke or a fire.
- Always connect a magnetic contactor between the power supply and the power supply (L1, L2, and L3) of the servo amplifier, in order to configure a circuit that shuts down the power supply on the side of the servo amplifier's power supply. If a magnetic contactor is not connected, continuous flow of a large current may cause smoke or a fire when the servo amplifier malfunctions.
- In order to configure a circuit that shuts down the power supply on the side of the servo amplifier's power supply, always connect one molded-case circuit breaker or fuse per servo amplifier between the power supply and the power supply (L1, L2, and L3) of a servo amplifier. If a molded-case circuit breaker or fuse is not connected, continuous flow of a large current may cause smoke or a fire when the servo amplifier malfunctions.
- •When using a regenerative resistor, shut the power off with the alarm signal. Otherwise, a regenerative transistor malfunction or the like may overheat the regenerative resistor, causing smoke or a fire.
- •When using a regenerative option with the MR-JE-40A to MR-JE-100A servo amplifier, remove the builtin regenerative resistor itself and wiring from the servo amplifier.
- Provide adequate protection to prevent screws and other conductive matter, oil and other combustible matter from entering the servo amplifier and servo motor.

# 3. To prevent injury, note the following.

# ▲ CAUTION

Only the voltage specified in the Instruction Manual should be applied to each terminal. Otherwise, a burst, damage, etc. may occur.

•Connect cables to the correct terminals. Otherwise, a burst, damage, etc. may occur.

●Ensure that polarity (+/-) is correct. Otherwise, a burst, damage, etc. may occur.

The servo amplifier heat sink, regenerative resistor, servo motor, etc. may be hot while the power is on, or for some time after power-off. Take safety measures, e.g. provide covers, to avoid accidentally touching the parts (cables, etc.) by hand.

# 4. Additional instructions

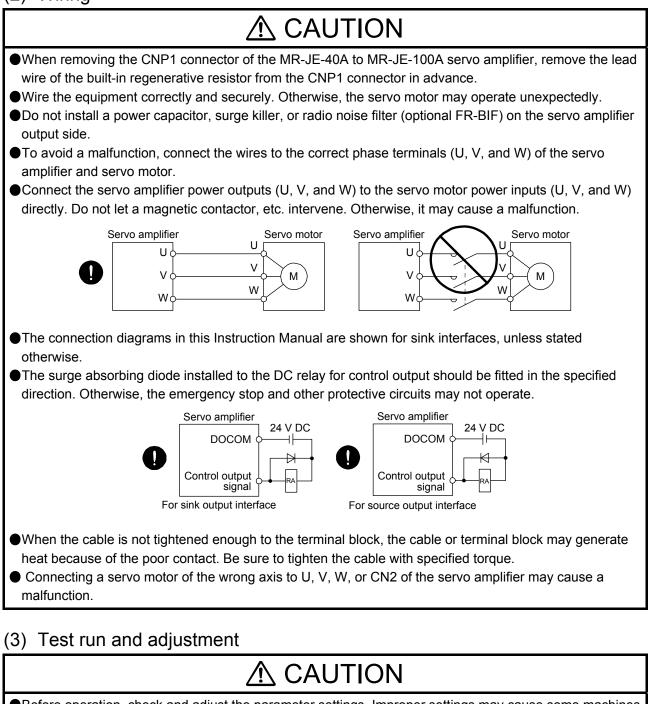

The following instructions should also be fully noted. Incorrect handling may cause a malfunction, injury, electric shock, fire, etc.

### (1) Transportation and installation

| È |   |  |  |
|---|---|--|--|
|   |   |  | ▲ CAUTION  |
|   | Transport th  | e products   | s correctly according to their mass.   |
|   | •   | •  | the specified number of product packages is not allowed.   |
|   | Do not hold the lead wire of the built-in regenerative resistor when transporting the servo amplifier.  |  |  |
|   | Install the servo amplifier and the servo motor in a load-bearing place in accordance with the Instruction                                      |  |  |
| l | Manual.   | -  |  |
|   |   | n or put he  | eavy load on the equipment.  |
|   | -   | •  | be installed in the specified direction.   |
|   |   |  | ances between the servo amplifier and cabinet walls or other equipment.  |
|   |   |  | te the servo amplifier and servo motor which have been damaged or have any   |
| - | parts missing   |  |  |
|   |   | -  | e and exhaust areas of the servo amplifier. Otherwise, it may cause a malfunction.   |
|   |   |  | he servo amplifier and servo motor. Isolate them from all impact loads.  |
|   |   |  | e the equipment, please fulfill the following environment.   |
|   |   |  |  |
|   | Item  | 1  | Environment  |
|   | Item<br>Ambient   | o<br>Operation   | Environment<br>0 °C to 55 °C (non-freezing)  |
|   |   | 1  |  |

Additionally, disinfect and protect wood from insects before packing the products.

### (2) Wiring

- Before operation, check and adjust the parameter settings. Improper settings may cause some machines to operate unexpectedly.
- •Never make a drastic adjustment or change to the parameter values as doing so will make the operation unstable.

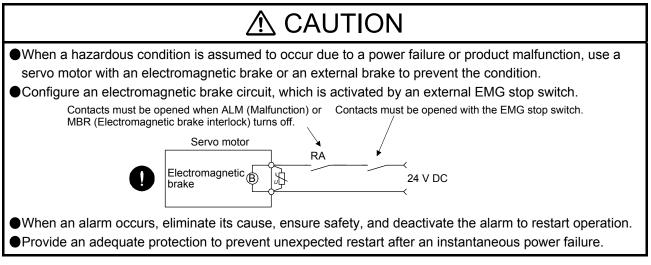

Do not get close to moving parts during the servo-on status.

### (4) Usage

# ▲ CAUTION

- Provide an external emergency stop circuit to ensure that operation can be stopped and power switched off immediately.
- Do not disassemble, repair, or modify the equipment.
- Before resetting an alarm, make sure that the run signal of the servo amplifier is off in order to prevent a sudden restart. Otherwise, it may cause an accident.
- •Use a noise filter, etc. to minimize the influence of electromagnetic interference. Electromagnetic interference may be given to the electronic equipment used near the servo amplifier.
- Burning or breaking a servo amplifier may cause a toxic gas. Do not burn or break it.
- ●Use the servo amplifier with the specified servo motor.
- The electromagnetic brake on the servo motor is designed to hold the motor shaft and should not be used for ordinary braking.
- •For such reasons as service life and mechanical structure (e.g. where a ball screw and the servo motor are coupled via a timing belt), the electromagnetic brake may not hold the motor shaft. To ensure safety, install a stopper on the machine side.

### (5) Corrective actions

### (6) Maintenance, inspection and parts replacement

# 

With age, the electrolytic capacitor of the servo amplifier will deteriorate. To prevent a secondary accident due to a malfunction, it is recommended that the electrolytic capacitor be replaced every 10 years when it is used in general environment. For replacement, please contact your local sales office.
 When using the serve amplifier that has not been energized for an extended period of time, contact your

•When using the servo amplifier that has not been energized for an extended period of time, contact your local sales office.

### (7) General instruction

• To illustrate details, the equipment in the diagrams of this Instruction Manual may have been drawn without covers and safety guards. When the equipment is operated, the covers and safety guards must be installed as specified. Operation must be performed in accordance with this Instruction Manual.

# • DISPOSAL OF WASTE •

Please dispose of this product in compliance with the following two applicable laws. The laws come into effect only in Japan. In a country other than Japan, local laws are prioritized. Please provide the following information by indicating it on the end product, etc. as necessary.

- 1. Requirements of the Act on the Promotion of Effective Utilization of Resources (socalled the Resource Recycling Promotion Law)
  - (1) The product that is no longer needed should be recycled whenever possible.
  - (2) Such a product is generally separated into iron scrap, electrical components, and others in the recycling process, and sold to scrap dealers. It is recommended that you separate the product as necessary and sell each separated item to appropriate dealers.
- 2. Requirements of the Waste Management and Public Cleansing Law (so-called the Waste Disposal Law)
  - (1) It is recommended that you make efforts to reduce the amount of waste by recycling or selling the waste product as described in the preceding paragraph 1, etc.
  - (2) When you cannot sell the waste product and therefore dispose of it, it must be treated as industrial waste specified in this law.
  - (3) You need to subcontract the disposal of industrial waste to industrial waste disposal companies qualified by this law, and take proper actions including the waste manifest management.

#### Servo amplifier harmonic suppression measures

The servo amplifiers are subject to the "guidelines for harmonic suppression measures for customers who receive high voltage or extra high voltage electricity" (issued by the current Ministry of Economy, Trade and Industry). Customers to which the guidelines are applied need to check the necessity of harmonic suppression measures. When the threshold is exceeded, the measures are required.

# \Lambda EEP-ROM life

The number of write times to the EEP-ROM, which stores parameter settings, etc., is limited to 100,000. If the total number of the following operations exceeds 100,000, the servo amplifier may malfunction when the EEP-ROM reaches the end of its useful life.

- · Write to the EEP-ROM due to parameter setting changes
- · Write to the EEP-ROM due to device changes
- Write to the EEP-ROM due to point table setting changes
- Write to the EEP-ROM due to program setting changes

#### Compliance with global standards

Refer to appendix 2 for the compliance with global standards.

#### «About the manual»

You must have this Instruction Manual and the following manuals to use this servo. Ensure to prepare them to use the servo safely.

#### Relevant manuals

| Manual name  | Manual No.    |
|--|---------------|
| MR-JEA Servo Amplifier Instruction Manual                        | SH(NA)030128  |
| MR-JEA Servo Amplifier Instruction Manual (Modbus-RTU Protocol)  | SH(NA)030177A |
| MELSERVO-JE Servo amplifier Instruction Manual (Troubleshooting) | SH(NA)030166  |
| MELSERVO HG-KN_/HG-SN_ Servo Motor Instruction Manual            | SH(NA)030135  |
| EMC Installation Guidelines                                      | IB(NA)67310   |

This Instruction Manual does not describe the following items. For the details of the items, refer to each chapter/section indicated in the detailed explanation field. "MR-JE-\_A" means "MR-JE-\_A Servo Amplifier Instruction Manual".

| Item                         | Detailed explanation |
|------------------------------|----------------------|
| Installation                 | MR-JEA Chapter 2     |
| Normal gain adjustment       | MR-JEA Chapter 6     |
| Special adjustment functions | MR-JEA Chapter 7     |

| Characteristics              | MR-JEA Chapter 10    |

«Cables used for wiring»

Wires mentioned in this Instruction Manual are selected based on the ambient temperature of 40 °C.

#### «U.S. customary units»

U.S. customary units are not shown in this manual. Convert the values if necessary according to the following table.

| Quantity                      | SI (metric) unit                            | U.S. customary unit            |
|-------------------------------|---|--------------------------------|
| Mass                          | 1 [kg]                                      | 2.2046 [lb]                    |
| Length                        | 1 [mm]                                      | 0.03937 [inch]                 |
| Torque                        | 1 [N•m]                                     | 141.6 [oz•inch]                |
| Moment of inertia             | 1 [(× 10 <sup>-4</sup> kg•m <sup>2</sup> )] | 5.4675 [oz•inch <sup>2</sup> ] |
| Load (thrust load/axial load) | 1 [N]                                       | 0.2248 [lbf]                   |
| Temperature                   | N [°C] × 9/5 + 32                           | N [°F]                         |

### 5. HOW TO USE THE PROGRAM

5- 1 to 5-68

| 5.1 Startup   |      |
|---|------|
| 5.1.1 Power on and off procedures                                   | 5- 1 |
| 5.1.2 Stop  |      |
| 5.1.3 Test operation  | 5- 3 |
| 5.1.4 Parameter setting   | 5- 4 |
| 5.1.5 Actual operation  |      |
| 5.1.6 Troubleshooting at start-up                                   | 5- 5 |
| 5.2 Program operation method  |      |
| 5.2.1 Program operation method                                      | 5- 6 |
| 5.2.2 Program language  | 5- 7 |
| 5.2.3 Basic settings of signals and parameters                      | 5-30 |
| 5.2.4 Timing chart of the program operation                         | 5-32 |
| 5.3 Manual operation mode   | 5-34 |
| 5.3.1 JOG operation   |      |
| 5.3.2 Manual pulse generator operation                              |      |
| 5.4 Home position return mode                                       |      |
| 5.4.1 Outline of home position return                               | 5-37 |
| 5.4.2 Dog type home position return                                 |      |
| 5.4.3 Count type home position return                               |      |
| 5.4.4 Data set type home position return                            |      |
| 5.4.5 Stopper type home position return                             |      |
| 5.4.6 Home position ignorance (servo-on position as home position)  |      |
| 5.4.7 Dog type rear end reference home position return              |      |
| 5.4.8 Count type front end reference home position return           |      |
| 5.4.9 Dog cradle type home position return                          |      |
| 5.4.10 Dog type last Z-phase reference home position return         |      |
| 5.4.11 Dog type front end reference home position return type       |      |
| 5.4.12 Dogless Z-phase reference home position return type          |      |
| 5.4.13 Automatic retract function used for the home position return |      |
| 5.5 Serial communication operation                                  |      |
| 5.5.1 Positioning operation using the program                       | 5-59 |

| 5.5.2 Multi-drop method (RS-422 communication) 5        | 5-60 |
|---|------|
| 5.5.3 Group specification                               | 5-61 |
| 5.6 Incremental value command method                    | 5-63 |
| 5.7 Roll feed mode using the roll feed display function | 5-64 |
| 5.8 Program setting method                              | 5-65 |
| 5.8.1 Setting procedure                                 | 5-65 |
| 5.8.2 Window for program edit                           | 5-66 |
| 5.8.3 Indirect addressing window                        | 5-67 |

#### 6. APPLICATION OF FUNCTIONS

6- 1 to 6-22

|         | Operation   |        |
| 6.2 Mai | rk detection  | 6-13   |
| 6.2.1   | Current position latch function                                   | 6-13   |
| 6.2.2   | Interrupt positioning function                                    | 6-19   |
|         |   |        |

### 7. PARAMETERS

7- 1 to 7-72

| 7.1 Parameter list  |              |
|---|--------------|
| 7.1.1 Basic setting parameters ([Pr. PA_ ])   |              |
| 7.1.2 Gain/filter setting parameters ([Pr. PB_ ])   |              |
| 7.1.3 Extension setting parameters ([Pr. PC_ ])   | 7- 5         |
| 7.1.4 I/O setting parameters ([Pr. PD_ ])   |              |
| 7.1.5 Extension setting 2 parameters ([Pr. PE_ ])   | 7- 9         |
| 7.1.6 Extension setting 3 parameters ([Pr. PF_ ])   | 7-10         |
| 7.1.7 Positioning control parameters ([Pr. PT_ ])   | 7-12         |
| 7.2 Detailed list of parameters   | 7-14         |
| 7.2.1 Basic setting parameters ([Pr. PA_ ])   | 7-14         |
| 7.2.2 Gain/filter setting parameters ([Pr. PB_ ])   | 7-24         |
| 7.2.3 Extension setting parameters ([Pr. PC_ ])   | 7-36         |
| 7.2.4 I/O setting parameters ([Pr. PD_ ])   |              |
| 7.2.5 Extension setting 2 parameters ([Pr. PE_ ])   | 7-58         |
| 7.2.6 Extension setting 3 parameters ([Pr. PF_ ])   | 7-58         |
| 7.2.7 Positioning control parameters ([Pr. PT_ ])   | 7-60         |
| 7.3 How to set the electronic gear  | 7-69         |
| 7.4 Software limit  | 7-70         |
| 7.5 Stop method for LSP (Forward rotation stroke end) off or LSN (Reverse rotation stroke end | ל) off 7-71  |
| 7.6 Stop method at software limit detection   | 7-72         |
| 8. TROUBLESHOOTING  | 8- 1 to 8- 6 |
|   |              |

| 8.2 | Alarm and warning list | 8- | 2 |
|-----|------------------------|----|---|
|     | Alarm list             |    |   |
| 8.4 | Warning list           | 8- | 6 |

### 9. OPTIONS AND PERIPHERAL EQUIPMENT

#### 9- 1 to 9- 4

#### 10. COMMUNICATION FUNCTION (MITSUBISHI GENERAL-PURPOSE AC SERVO PROTOCOL) 10-1 to 10-32

| 10.1 Co  | nmand and data No. list                                     |       |
|----------|---|-------|
| 10.1.1   | Reading command   |       |
| 10.1.2   | Writing commands  | 10-11 |
| 10.2 Det | ailed explanations of commands                              |       |
| 10.2.1   | External I/O signal status (DIO diagnosis)                  | 10-15 |
| 10.2.2   | Input device on/off   |       |
| 10.2.3   | Input device on/off (for test operation)                    |       |
| 10.2.4   | Test operation mode   | 10-22 |
| 10.2.5   | Output signal pin on/off (output signal (DO) forced output) |       |
| 10.2.6   | Point table   | 10-25 |

For the details of the items, refer to each chapter/section (in "MR-JE-\_A Servo Amplifier Instruction Manual") indicated in the detailed explanation field.

| Item  | Detailed explanation |
|---|----------------------|
| item  | MR-JEA               |
| Combinations of servo amplifiers and servo motors | Section 1.4          |
| Model designation                                 | Section 1.6          |
| Structure (parts identification)                  | Section 1.7          |

#### 1.1 For proper use of the positioning mode

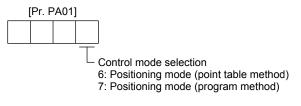

(1) Servo amplifier/MR Configurator2

The positioning mode is available with the servo amplifier and MR Configurator2 with the following software versions.

| Product name     | Model       | Software version |  |  |  |
|------------------|-------------|------------------|--|--|--|
| Servo amplifier  | MR-JEA      | B7 or later      |  |  |  |
| MR Configurator2 | SW1DNC-MRC2 | 1.37P or later   |  |  |  |

#### (2) Parameter setting

(a) Selection of the positioning mode
 Select a positioning mode with [Pr. PA01 Operation mode].

- (b) Positioning control parameters ([Pr. PT\_\_]) To enable read/write the positioning control parameters ([Pr. PT\_\_]), set [Pr. PA19 Parameter writing inhibit] to "0 0 A B".
- (c) Assigning recommended input/output devices Assign recommended input/output devices to the pins of CN1 in accordance with each chapter of the point table/program method.

#### 1.2 Positioning mode specification list

Only the specifications of the positioning mode are listed here. For other specifications, refer to section 1.3 of "MR-JE-A Servo Amplifier Instruction Manual".

Note 1. STM is the ratio to the setting value of the position data. STM can be changed with [Pr. PT03 Feeding function selection].

2. Up to four points of DO are available; therefore, PT0 (Point table No. output 1) to PT4 (Point table No. output 5) cannot be outputted simultaneously.

#### 1.3 Function list

| POINT                                     |   |  |  |  |  |  |  |  |
|---|---|--|--|--|--|--|--|--|
| •The symbols                              | s in the control mode column mean as follows. |  |  |  |  |  |  |  |
| CP: Positioning mode (point table method) |   |  |  |  |  |  |  |  |
| CL: Position                              | CL: Positioning mode (program method)         |  |  |  |  |  |  |  |

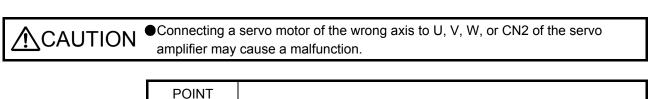

The following table lists the functions of this servo. For details of the functions, refer to each section indicated in the detailed explanation field. "MR-JE-\_A" means "MR-JE-\_ A Servo Amplifier Instruction Manual".

| Function                             |  | Description   |   | ntrol<br>ode | Detailed                   |
|--------------------------------------|--|---|---|--------------|----------------------------|
|                                      |  | Description   |   |              | explanation                |
| Model adaptive control               |  | This function achieves a high response and stable control following the ideal<br>model. The two-degrees-of-freedom model adaptive control enables you to<br>set a response to the command and response to the disturbance separately.<br>Additionally, this function can be disabled. To disable this function, refer to<br>section 7.5 of "MR-JE-A_ Servo Amplifier Instruction Manual". This is<br>available with servo amplifiers with software version B7 or later. Check the<br>software version using MR Configurator2. |   | 0            |                            |
| Positioning m<br>table method        |  | Set 1 to 31 point tables in advance, and select any point table to perform operation in accordance with the set values. To select point tables, use external input signals or communication function.   | 0 |              | Chapter 4                  |
| Positioning m<br>(program me         |  | Set 1 to 16 programs in advance and select any program to perform operation in accordance with the programs. To select programs, use external input signals or communication function.  |   | 0            | Chapter 5                  |
| Roll feed disp                       | play function                            | Positions based on specified travel distance from a status display "0" of<br>current/command positions at start.  | 0 | 0            | Section 4.5                |
| Mark                                 | Current<br>position<br>latch<br>function | When the mark detection signal turns on, the current position is latched. The latched data can be read with communication commands.   | 0 | 0            | Section<br>6.6.2           |
| detection                            | Interrupt<br>positioning<br>function     | When MSD (Mark detection) turns on, this function converts the remaining distance to the travel amount set in [Pr. PT30] and [Pr. PT31] (Mark sensor stop travel distance).<br>This is available with servo amplifiers with software version B7 or later.   | 0 | 0            | Section<br>6.2.3           |
| Home positio                         | n return                                 | Dog type/count type/data setting type/stopper type/home position<br>ignorance/dog type rear end reference/count type front end reference/dog<br>cradle type/dog type last Z-phase reference/dog type Z-phase<br>reference/dogless Z-phase reference   | 0 | 0            | Section 4.4<br>Section 5.4 |
| High-resolution                      | on encoder                               | Rotary servo motors compatible with MELSERVO-JE series are equipped with high-resolution encoder of 131072 pulses/rev.  | 0 | 0            |                            |
| Gain switchin                        | ng function                              | You can switch gains during rotation/stop, and can use input devices to switch gains during operation.  | 0 | 0            | MR-JEA<br>Section 7.2      |
| Advanced vit                         |  | This function suppresses vibration at an arm end or residual vibration.   | 0 | 0            | MR-JEA<br>Section<br>7.1.5 |
| Machine resonance suppression filter |  | This filter function (notch filter) decreases the gain of the specific frequency to suppress the resonance of the mechanical system.  | 0 | 0            | MR-JEA<br>Section<br>7.1.1 |
| Shaft resonance suppression filter   |  | When a load is mounted to the servo motor shaft, resonance by shaft torsion during driving may generate a mechanical vibration at high frequency. The shaft resonance suppression filter suppresses the vibration.  | 0 | 0            | MR-JEA<br>Section<br>7.1.3 |
| Adaptive filter II                   |  | The servo amplifier detects mechanical resonance and sets filter characteristics automatically to suppress mechanical vibration.  | 0 | 0            | MR-JEA<br>Section<br>7.1.2 |
| Low-pass filte                       | er                                       | Suppresses high-frequency resonance which occurs as the servo system response is increased.   | 0 | 0            | MR-JEA<br>Section<br>7.1.4 |

| Function                                     | Description   |        |        | Detailed   |
|--|---|--------|--------|--|
| T unclion                                    | Description   | C<br>P | C<br>L | explanation  |
| Machine analyzer function                    | Analyzes the frequency characteristic of the mechanical system by simply connecting an MR Configurator2 installed personal computer and the servo amplifier.<br>MR Configurator2 is necessary for this function.                  | 0      | 0      |  |
| Robust filter                                | For roll feed axis, etc. of which a response level cannot be increased because of the large load to motor inertia ratio, this function improves a disturbance response.   | 0      | 0      | [Pr. PE41]   |
| Slight vibration<br>suppression control      | Suppresses vibration of ±1 pulse generated at a servo motor stop.   | 0      | 0      | [Pr. PB24]   |
| Electronic gear                              | Position commands can be multiplied by 1/864 to 33935.  | 0      | 0      | [Pr. PA06]<br>[Pr. PA07]   |
| Auto tuning                                  | Automatically adjusts the gain to optimum value if load applied to the servo motor shaft varies.  | 0      | 0      | MR-JEA<br>Section 6.3  |
| Regenerative option                          | Use a regenerative option when the built-in regenerative resistor of the servo amplifier does not have sufficient regenerative capacity for a large regenerative power generated.   | 0      | 0      | MR-JEA<br>Section<br>11.2  |
| Alarm history clear                          | Clears alarm histories.   | 0      | 0      | [Pr. PC18]   |
| Input signal selection<br>(device settings)  | ST1 (Forward rotation start), ST2 (Reverse rotation start), and SON (Servo-<br>on) and other input device can be assigned to certain pins of the CN1<br>connector.  | 0      | 0      | [Pr. PD20]<br>[Pr. PD44]<br>[Pr. PD46]                             |
| Output signal selection<br>(device settings) | The output devices including MBR (Electromagnetic brake interlock) can be assigned to certain pins of the CN1 connector.  | 0      | 0      | [Pr. PD24]<br>to<br>[Pr. PD26]<br>[Pr. PD28]<br>[Pr. PD47]         |
| Output signal (DO) forced output             | Turns on/off the output signals forcibly independently of the servo status.<br>Use this function for checking output signal wiring, etc.  | 0      | 0      | MR-JEA<br>Section<br>4.5.8   |
| Command pulse selection                      | Supports only A-phase/B-phase pulse trains.   | 0      | 0      | [Pr. PA13]   |
| Torque limit                                 | Limits the servo motor torque.  | 0      | 0      | [Pr. PA11]<br>[Pr. PA12]   |
| Status display                               | Shows servo status on the 5-digit, 7-segment LED display  | 0      | 0      | Section<br>3.1.2   |
| External I/O signal display                  | Shows on/off statuses of external I/O signals on the display.   | 0      | 0      | Section<br>3.1.7   |
| Alarm code output                            | If an alarm has occurred, the corresponding alarm number is outputted in 3-<br>bit code.  | 0      | 0      | Chapter 8  |
| Test operation mode                          | Jog operation/positioning operation/motor-less operation/DO forced<br>output/program operation/single-step feed<br>Note that MR Configurator2 is necessary for positioning operation, program<br>operation, and single-step feed. | 0      | 0      | Section<br>3.1.8<br>Section<br>3.1.9<br>MR-JEA<br>Section<br>4.5.9 |
| Analog monitor output                        | Outputs servo status with voltage in real time.   | 0      | 0      | [Pr. PC14]<br>[Pr. PC15]   |
| MR Configurator2                             | Using a personal computer, you can perform the parameter setting, test operation, monitoring, and others.   | 0      | 0      | MR-JEA<br>Section<br>11.7  |
| One-touch tuning                             | Adjusts gains just by pressing buttons on the servo amplifier or by clicking a button on MR Configurator2.  | 0      | 0      | MR-JEA<br>Section 6.2  |
| Tough drive function                         | This function makes the equipment continue operating even under the condition that an alarm occurs.<br>The tough drive function includes two types: the vibration tough drive and the instantaneous power failure tough drive.    | 0      | 0      | MR-JEA<br>Section 7.3  |

|  | Description  |   |   | Detailed  |
|--|--|---|---|---|
| Function                                   |  |   |   | explanation   |
| Drive recorder function                    | <ul> <li>This function continuously monitors the servo status and records the status transition before and after an alarm for a fixed period of time. You can check the recorded data on the drive recorder window on MR Configurator2 by clicking the "Graph" button.</li> <li>However, the drive recorder is not available when: <ol> <li>The graph function of MR Configurator2 is being used.</li> <li>The machine analyzer function is being used.</li> <li>[Pr. PF21] is set to "-1".</li> </ol> </li> </ul> | 0 | 0 | [Pr. PA23]  |
| Servo amplifier life<br>diagnosis function | You can check the cumulative energization time and the number of on/off<br>times of the inrush relay. This function gives an indication of the replacement<br>time for parts of the servo amplifier including a capacitor and a relay before<br>they malfunction.<br>MR Configurator2 is necessary for this function.  | 0 | 0 |   |
| Power monitoring function                  | This function calculates the power running energy and the regenerative power from the data in the servo amplifier such as speed and current. Power consumption and others are displayed on MR Configurator2.   | 0 | 0 |   |
| Machine diagnosis<br>function              | From the data in the servo amplifier, this function estimates the friction and vibrational component of the drive system in the equipment and recognizes an error in the machine parts, including a ball screw and bearing.<br>MR Configurator2 is necessary for this function.  | 0 | 0 |   |
| Limit switch                               | Limits travel intervals using LSP (Forward rotation stroke end) and LSN (Reverse rotation stroke end).   | 0 | 0 |   |
| S-pattern<br>acceleration/deceleration     | Enables smooth acceleration and deceleration.<br>Set S-pattern acceleration/deceleration time constants with [Pr. PC03].<br>As compared with linear acceleration/deceleration, the<br>acceleration/deceleration time will be longer for the S-pattern<br>acceleration/deceleration time constants regardless of command speed.   | 0 | 0 | [Pr. PC03]<br>Section<br>5.2.2  |
| Software limit                             | Limits travel intervals by address using parameters.<br>Enables the same function with the limit switch by setting parameters.   | 0 | 0 | Section 7.4   |
| Analog override                            | Limits a servo motor speed with analog inputs.<br>A value can be changed from 0% to 200% for a set speed.  | 0 | 0 | Section 2.4   |
| Teaching function                          | After an operation travels to a target position with a JOG operation or manual pulse generator operation, pushing the SET button of the operation part or turning on TCH (Teach) will import position data.  | 0 |   | Section<br>3.1.10   |
| Simple cam function                        | This function enables synchronous control by using software instead of controlling mechanically with cam. Synchronous operation and synchronous interpolation operation between two axes can be performed using the encoder following function, the mark sensor input compensation function, and the positioning data.<br>This is available with servo amplifiers with software version B7 or later.   | 0 | 0 | Section 6.1   |
| Modbus-RTU<br>communication function       | The Modbus protocol uses dedicated message frames for the serial communication between a master and slaves. The dedicated message frames have functions for reading and writing data, and you can write parameters from servo amplifiers and check the operation status of the servo amplifiers by using this function.  | 0 | 0 | MR-JEA<br>Servo<br>Amplifier<br>Instruction<br>Manual<br>(Modbus-<br>RTU<br>Protocol) |

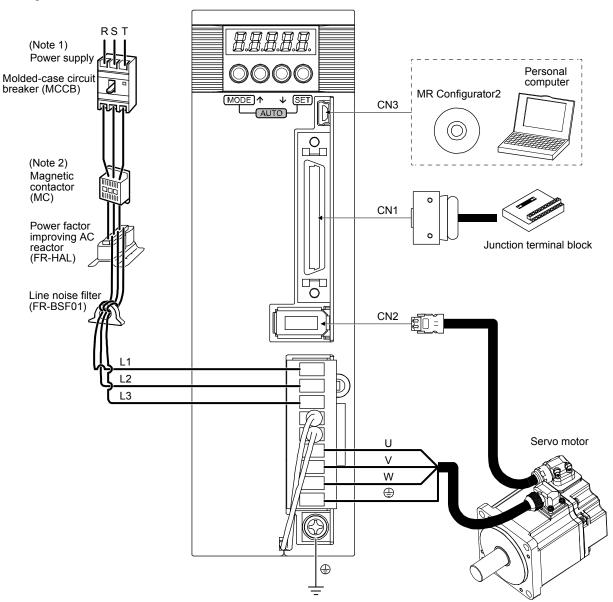

1.4 Configuration including peripheral equipment

Equipment other than the servo amplifier and servo motor are optional or recommended products.

(1) MR-JE-100A or less

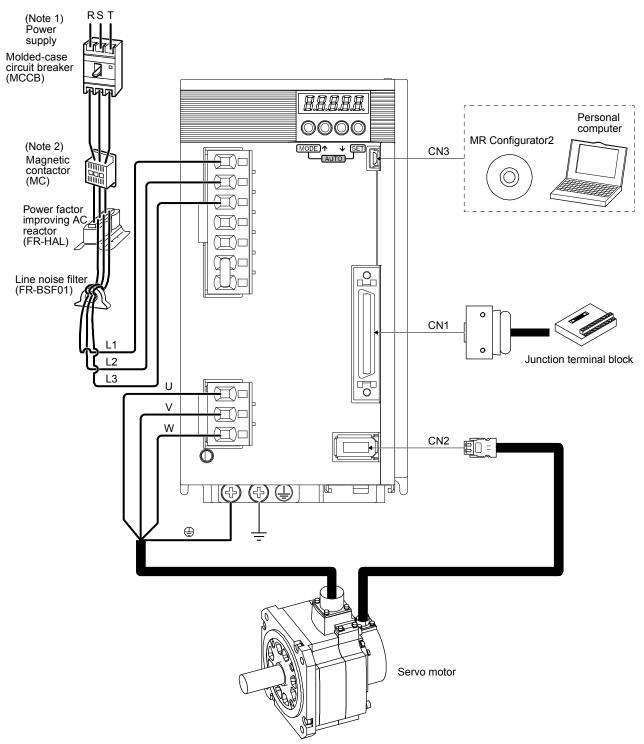

The diagram shows MR-JE-40A.

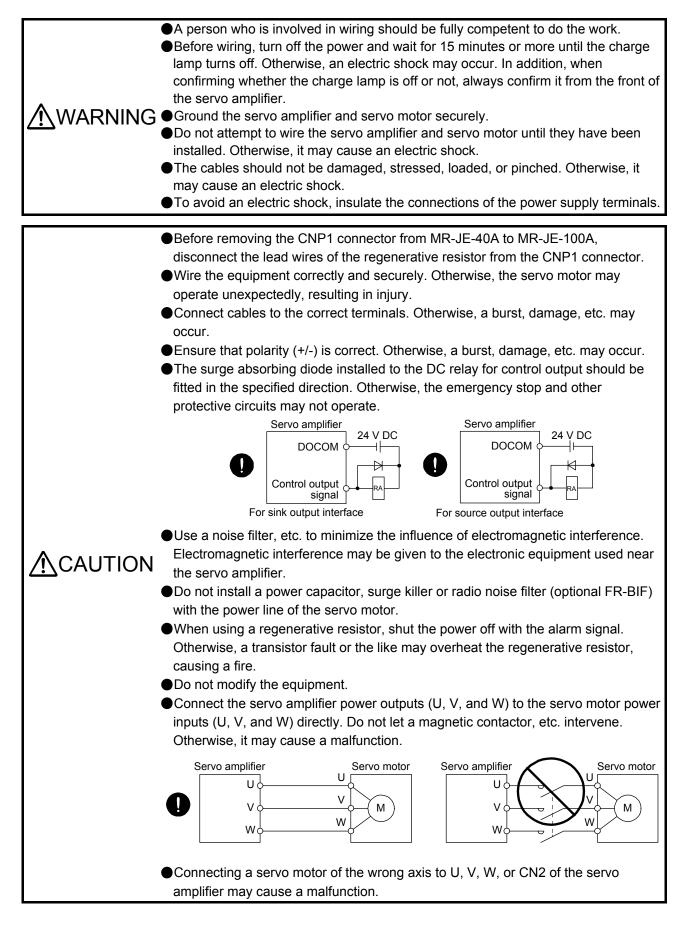

- Note 1. A 1-phase 200 V AC to 240 V AC power supply may be used with the servo amplifier of MR-JE-70A or less. For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. For power supply specifications, refer to section 1.3 of "MR-JE-\_A Servo Amplifier Instruction Manual".
  - 2. Depending on the power supply voltage and operation pattern, a bus voltage may drop, causing dynamic brake deceleration during forced stop deceleration. When dynamic brake deceleration is not required, delay the time to turn off the magnetic contactor.

(2) MR-JE-200A or more

The diagram shows MR-JE-200A.

- Note 1. For power supply specifications, refer to section 1.3 of "MR-JE-\_A Servo Amplifier Instruction Manual".
  - 2 Depending on the power supply voltage and operation pattern, a bus voltage may drop, causing dynamic brake deceleration during forced stop deceleration. When dynamic brake deceleration is not required, delay the time to turn off the magnetic contactor.

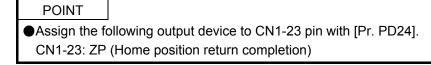

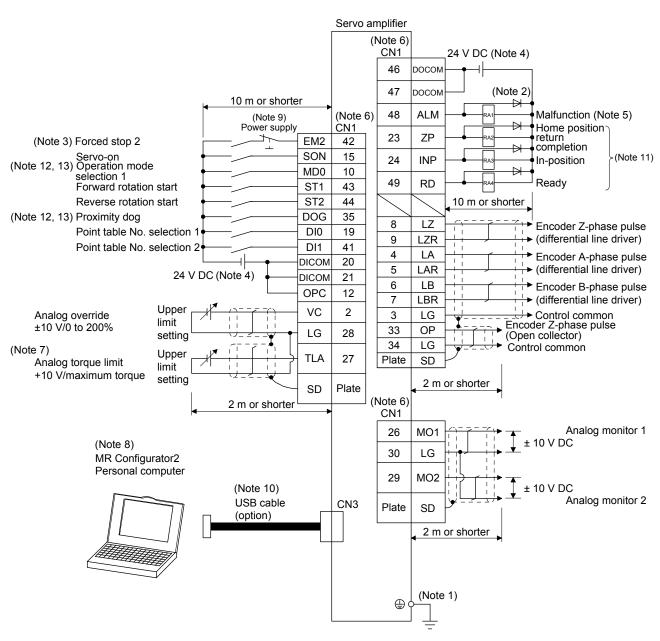

For the details of the following items, refer to chapter/section (of "MR-JE-\_A Servo Amplifier Instruction Manual") indicated in the table.

| ltem  | Detailed explanation |
|---|----------------------|
| item  | MR-JEA               |
| Input power supply circuit  | Section 3.1          |
| Explanation of power supply system (except for section 2.6 Power-on sequence) | Section 3.3          |
| Detailed explanation of signals   | Section 3.6          |
| Forced stop deceleration function   | Section 3.7          |
| Alarm occurrence timing chart   | Section 3.8          |
| Interface (except for section 2.5 Internal connection)                        | Section 3.9          |
| Servo motor with an electromagnetic brake                                     | Section 3.10         |
| Grounding   | Section 3.11         |

#### 2.1 I/O signal connection example

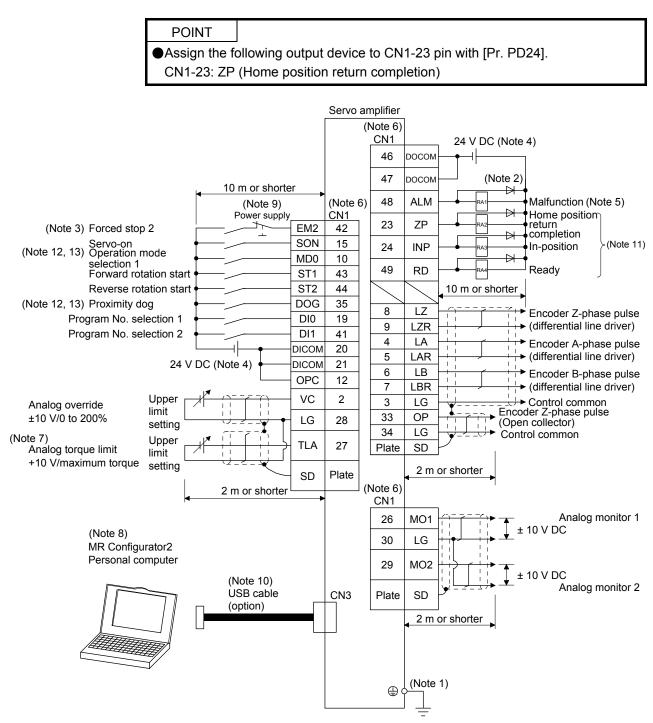

#### (1) Point table method

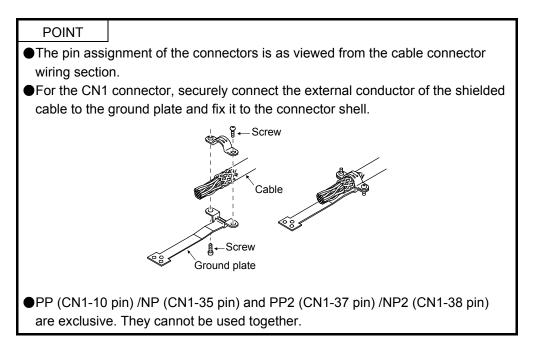

- Note 1. To prevent an electric shock, always connect the protective earth (PE) terminal (marked ) of the servo amplifier to the protective earth (PE) of the cabinet.
  - 2. Connect the diode in the correct direction. If it is connected reversely, the servo amplifier will malfunction and will not output signals, disabling EM2 (Forced stop 2) and other protective circuits.
  - 3. The forced stop switch (normally closed contact) must be installed.
  - 4. Supply 24 V DC ± 10% to interfaces from outside. The total current capacity of these power supplies must be 300 mA or lower. 300 mA is the value applicable when all I/O signals are used. The current capacity can be decreased by reducing the number of I/O points. Refer to section 3.9.2 (1) that gives the current value necessary for the interface. The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
  - 5. ALM (Malfunction) turns on in normal alarm-free condition (normally closed contact).
  - 6. The pins with the same signal name are connected in the servo amplifier.
  - 7. TLA will be available when TL (External torque limit selection) is enabled with [Pr. PD03], [Pr. PD11], [Pr. PD13], [Pr. PD17], and [Pr. PD19]. (Refer to section 3.6.1 (5).)
  - 8. Use SW1DNC MRC2-\_. (Refer to section 11.4.)
  - 9. To prevent an unexpected restart of the servo amplifier, configure a circuit to turn off EM2 when the power is turned off.
  - 10. The USB communication function and RS-422/RS-485 communication function are mutually exclusive. They cannot be used together.
  - 11. Recommended device assignments are shown. The device can be changed by [Pr. PD24] to [Pr. PD25], and [Pr. PD28].
  - 12. DI2 and DI3 are assigned to the CN1-10 and CN1-35 pins by default. When connecting a manual pulse generator, change them with [Pr. PD44] and [Pr. PD46]. Refer to section 9.1 for details of the manual pulse generator.
  - 13. Supply + of 24 DC V to OPC (Power input for open-collector sink interface) when input devices are assigned to the CN1-10 pin and the CN-35 pin. They cannot be used with source input interface. For the positioning mode, input devices (DI2 and DI3) are assigned by default.

#### (2) Program method

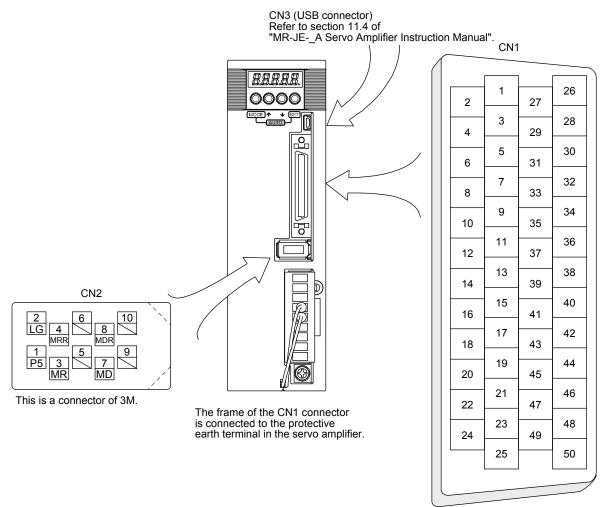

- Note 1. To prevent an electric shock, always connect the protective earth (PE) terminal (marked ) of the servo amplifier to the protective earth (PE) of the cabinet.
  - 2. Connect the diode in the correct direction. If it is connected reversely, the servo amplifier will malfunction and will not output signals, disabling EM2 (Forced stop 2) and other protective circuits.
  - 3. The forced stop switch (normally closed contact) must be installed.
  - 4. Supply 24 V DC ± 10% to interfaces from outside. The total current capacity of these power supplies must be 300 mA or lower. 300 mA is the value applicable when all I/O signals are used. The current capacity can be decreased by reducing the number of I/O points. Refer to section 3.9.2 (1) that gives the current value necessary for the interface. The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
  - 5. ALM (Malfunction) turns on in normal alarm-free condition (normally closed contact).
  - 6. The pins with the same signal name are connected in the servo amplifier.
  - 7. TLA will be available when TL (External torque limit selection) is enabled with [Pr. PD03], [Pr. PD11], [Pr. PD13], [Pr. PD17], and [Pr. PD19]. (Refer to section 3.6.1 (5).)
  - 8. Use SW1DNC MRC2-\_. (Refer to section 11.4.)
  - 9. To prevent an unexpected restart of the servo amplifier, configure a circuit to turn off EM2 when the power is turned off.
  - 10. The USB communication function and RS-422/RS-485 communication function are mutually exclusive. They cannot be used together.
  - 11. Recommended device assignments are shown. The device can be changed by [Pr. PD24] to [Pr. PD25], and [Pr. PD28].
  - 12. DI2 and DI3 are assigned to the CN1-10 and CN1-35 pins by default. When connecting a manual pulse generator, change them with [Pr. PD44] and [Pr. PD46]. Refer to section 9.1 for details of the manual pulse generator.
  - 13. Supply + of 24 DC V to OPC (Power input for open-collector sink interface) when input devices are assigned to the CN1-10 pin and the CN-35 pin. They cannot be used with source input interface. For the positioning mode, input devices (DI2 and DI3) are assigned by default.

#### 2.2 Connectors and pin assignment

The following is the front view of MR-JE-40A or less. For external appearance, connector arrangements, and details of other servo amplifiers, refer to chapter 9 of "MR-JE-\_A Servo Amplifier Instruction Manual".

The device assignment of the CN1 connector pins changes depending on the control mode. For the pins which are given parameters in the related parameter column, their devices can be changed using those parameters.

- Note 1. I: input signal, O: output signal
  - 2. CP: Positioning mode (point table method) CL: Positioning mode (program method)
  - 3. TLA will be available when TL (External torque limit selection) is enabled with [Pr. PD04], [Pr. PD12], [Pr. PD14], [Pr. PD18], [Pr. PD20], and [Pr. PD44].
  - 4. This is available with servo amplifiers with software version B7 or later.
  - This is used with sink interface. Input devices are not assigned by default. Assign the input devices with [Pr. PD44] and [Pr. PD46] as necessary. In addition, supply + of 24 DC V to the CN1-12 pin of OPC (Power input for open-collector sink interface). This is available with servo amplifiers with software version B7 or later.
  - 6. This is used with source interface. Input devices are not assigned by default. Assign the input devices with [Pr. PD44] and [Pr. PD46] as necessary.
  - 7. These pins are available with servo amplifiers having software version B7 or later, and manufactured in May, 2015 or later.
  - Assign the following output device to CN1-23 pin with [Pr. PD24]. CN1-23: ZP (Home position return completion)

#### 2.3 Signal (device) explanations

The connector pin No. column in the table lists the pin Nos. which devices are assigned to by default. For the I/O interfaces (symbols in I/O division column in the table), refer to section 2.5. The symbols in the control mode field of the table shows the followings.

CP: Positioning mode (point table method)

CL: Positioning mode (program method)

"O" and " $\Delta$  " of the table shows the followings.

O: Usable device by default.

 $\Delta$ : Usable device by setting the following parameters.

[Pr. PD04], [Pr. PD12], [Pr. PD14], [Pr. PD18], [Pr. PD24] to [Pr. PD26], [Pr. PD28], [Pr. PD44], [Pr. PD46], and [Pr. PD47]

#### (2) Input signal

| Device                 | Symbol | Connector<br>pin No. | Function and application   | I/O<br>division |   | ntrol<br>ode<br>C<br>L |
|------------------------|--------|----------------------|--|-----------------|---|------------------------|
| Manual pulse generator | PP     | (CN1-10)             | Connect the manual pulse generator (MR-HDP01).<br>When using the signal, enable PP and NP with [Pr. PD44] and [Pr. PD46].  | DI-2            | Δ | Δ                      |
| generator              | NP     | (CN1-35)             |  |                 |   |                        |
| Analog torque<br>limit | TLA    | CN1-27               | When using the signal, enable TL (External torque limit selection) with [Pr. PD04], [Pr. PD12], [Pr. PD14], [Pr. PD18], [Pr. PD20], [Pr. PD44], and [Pr. PD46].<br>When TLA is enabled, torque is limited in the full servo motor output torque range. Apply 0 V to +10 V DC between TLA and LG. Connect + of the power supply to TLA. The maximum torque is generated at +10 V. (Refer to section 3.6.1 (5) of "MR-JEA Servo Amplifier Instruction Manual".)<br>If a value equal to or larger than the maximum torque.<br>Resolution: 10 bits | Analog<br>input |   | Δ                      |
| Analog override        | VC     | CN1-2                | The signal controls the servo motor setting speed by applying -10 V to +10 V to between VC and LG. The percentage will be 0% with -10 V, 100% with 0 V, and 200% with +10 V to the setting speed of the servo motor. Resolution: 14 bits or equivalent   | Analog<br>input | 0 | 0                      |

### (3) Output signal

| Device   | Symbol    | Connector<br>pin No. | Function and application   | I/O<br>division  |   | ntrol<br>ode<br>C<br>L |
|--|-----------|----------------------|--|------------------|---|------------------------|
| Encoder A-<br>phase pulse<br>(differential line<br>driver) | LA<br>LAR | CN1-4<br>CN1-5       | These devices output pulses of encoder output pulse set in [Pr. PA15] in the differential line driver type.<br>In CCW rotation of the servo motor, the encoder B-phase pulse lags the encoder A-phase pulse by a phase angle of $\pi/2$ .  | DO-2             | 0 | 0                      |
| Encoder B-<br>phase pulse<br>(differential line<br>driver) | LB<br>LBR | CN1-6<br>CN1-7       | The relation between rotation direction and phase difference of the A-<br>phase and B-phase pulses can be changed with [Pr. PC19].   |                  |   |                        |
| Encoder Z-<br>phase pulse<br>(differential line<br>driver) | LZ<br>LZR | CN1-8<br>CN1-9       | The encoder zero-point signal is outputted in the differential line driver type. One pulse is outputted per servo motor revolution. This turns on when the zero-point position is reached. (negative logic) The minimum pulse width is about 400 $\mu$ s. For home position return using this pulse, set the creep speed to 100 r/min or less. | DO-2             | 0 | 0                      |
| Encoder Z-<br>phase pulse<br>(open-collector)              | OP        | CN1-33               | The encoder zero-point signal is outputted in the open-collector type.   | DO-2             | 0 | 0                      |
| Analog monitor 1   | MO1       | CN6-3                | This is used to output the data set in [Pr. PC14] to between MO1 and LG in terms of voltage.<br>Output voltage: ±10 V<br>Resolution: 10 bits or equivalent   | Analog<br>output | 0 | 0                      |
| Analog monitor 2   | MO2       | CN6-2                | This signal outputs the data set in [Pr. PC15] to between MO2 and LG in terms of voltage.<br>Output voltage: ±10 V<br>Resolution: 10 bits or equivalent  | Analog<br>output | 0 | 0                      |

#### (4) Communication

| Device        | Symbol | Connector<br>pin No. | Function and application                             | I/O<br>division | Con<br>mo<br>C<br>P | de |
|---------------|--------|----------------------|--|-----------------|---------------------|----|
| RS-422/RS-485 | SDP    | CN3-5                | These are terminals for RS-422/RS-485 communication. | Ν               | 0                   | 0  |
| I/F           | SDN    | CN3-4                |  | $\backslash$    |                     |    |
|               | RDP    | CN3-3                |  |                 |                     |    |
|               | RDN    | CN3-6                |  |                 |                     |    |
|               | TRE    | CN1-31               |  |                 |                     |    |

#### 2.4 Analog override

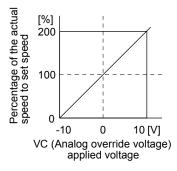

| POINT                     |   |  |  |  |  |  |  |  |
|---------------------------|---|--|--|--|--|--|--|--|
| When using                | When using the analog override in the point table method or program method, |  |  |  |  |  |  |  |
| enable OVR                | (Analog override selection).  |  |  |  |  |  |  |  |
| The following             | g shows functions whether usable or not with the analog override.           |  |  |  |  |  |  |  |
| (1) Analog                | override usable   |  |  |  |  |  |  |  |
| <ul> <li>Autor</li> </ul> | natic operation mode (point table method/program method)                    |  |  |  |  |  |  |  |
| - JOG                     | operation in the manual operation mode                                      |  |  |  |  |  |  |  |
| <ul> <li>Autor</li> </ul> | natic positioning to home position function in the point table method       |  |  |  |  |  |  |  |
| (2)Analog ov              | verride unusable  |  |  |  |  |  |  |  |
| • Manu                    | al pulse generator operation in the manual operation mode                   |  |  |  |  |  |  |  |
| • Home                    | <ul> <li>Home position return mode</li> </ul>                               |  |  |  |  |  |  |  |
| • Test o                  | operation mode using MR Configurator2 (positioning operation/JOG            |  |  |  |  |  |  |  |
| opera                     | tion)   |  |  |  |  |  |  |  |

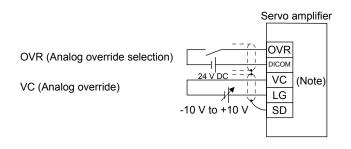

You can change the servo motor speed by using VC (Analog override). The following table shows signals and parameters related to the analog override.

| Item                 | Name                              | Remark   |
|----------------------|-----------------------------------|--|
| Analog input signal  | VC (Analog override)              |  |
| Contact input signal | OVR (Analog override selection)   | Turning on OVR enables VC (Analog override) setting value. |
| Parameter            | [Pr. PC37 Analog override offset] | -9999 to 9999 [mV]   |

#### (1) VC (Analog override)

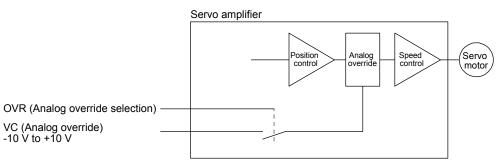

You can continuously set changed values from outside by applying voltage (-10 to +10 V) to VC (Analog override). The following shows percentage of the actual speed to input voltage and set speed.

(2) OVR (Analog override selection) Enable or disable VC (Analog override).

Select a changed value by using OVR (Analog override selection).

| (Note) External input signal | Speed change value                          |
|------------------------------|---|
| 0                            | No change                                   |
| 1                            | Setting of VC (Analog override) is enabled. |
|                              |   |

Note. 0: Off 1: On

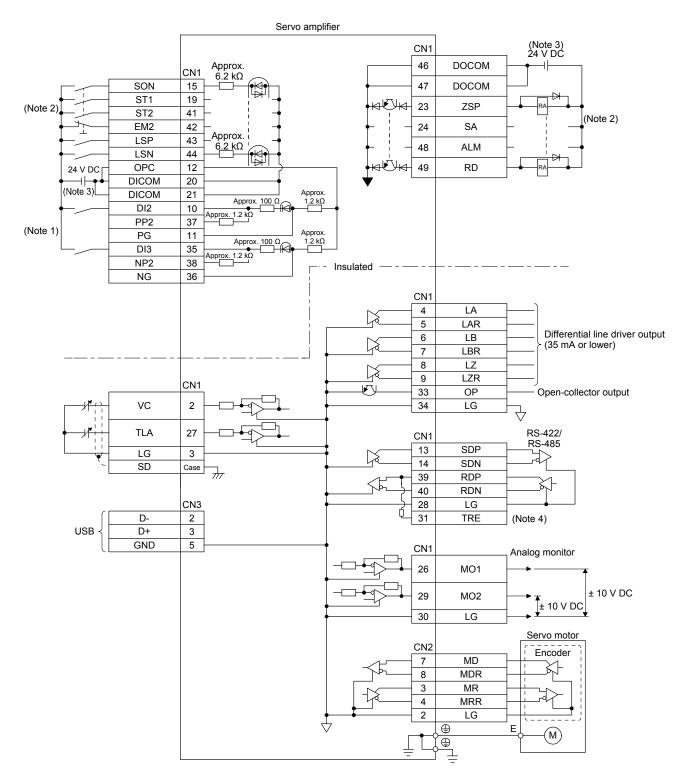

(3) Analog override offset ([Pr. PC37])

You can set an offset voltage to the input voltage of VC (Analog override) with [Pr. PC37]. The setting value ranges from -9999 to +9999 [mV].

#### 2.5 Internal connection diagram

| POINT   |
|---|
| ●For details of interface and source I/O interface, refer to section 3.9 of "MR-JE- |
| _A Servo Amplifier Instruction Manual".   |

The following shows an example of internal connection diagram of the point table method.

- Note 1. Refer to section 9.1 for the connection of a manual pulse generator.
  - This diagram shows sink I/O interface. For source I/O interface, refer to section 3.9.3 of "MR-JE-\_A Servo Amplifier Instruction Manual".
  - 3. The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.
  - 4. To use the RS-422/RS-485 communication function, connect between TRE and RDN of the final axis servo amplifier. (Refer to section 12.1.1.)

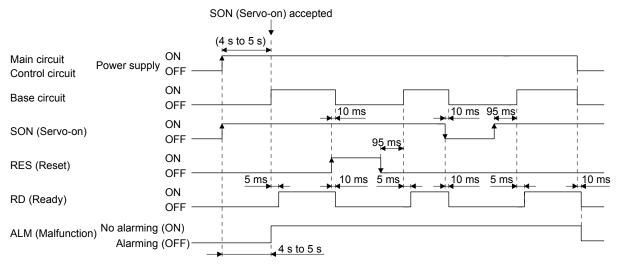

#### 2.6 Power-on sequence

| POINT       |  |
|-------------|--|
| The voltage | of analog monitor output, output signal, etc. may be unstable at |
| power-on.   |  |

#### (1) Power-on procedure

- Always use a magnetic contactor for the power supply wiring (L1, L2, and L3) as shown in section 3.1. Configure an external sequence to switch off the magnetic contactor as soon as an alarm occurs.
- 2) The servo amplifier receives the SON (Servo-on) in 4 s to 5 s after the power supply is switched on. Therefore, when SON (Servo-on) is switched on simultaneously with the power supply, the base circuit will switch on in about 4 s to 5 s, and the RD (Ready) will switch on in further about 5 ms, making the servo amplifier ready to operate. (Refer to (2) of this section.)
- 3) When RES (Reset) is switched on, the base circuit is shut off and the servo motor shaft coasts.

#### (2) Timing chart

# 3. DISPLAY AND OPERATION SECTIONS

For the details of the following items, refer to chapter/section (of "MR-JE-\_A Servo Amplifier Instruction Manual") indicated in the table.

| Item                | Detailed explanation |
|---------------------|----------------------|
|                     | MR-JEA               |
| Test operation mode | Section 4.5.9        |

### 3.1 MR-JE-\_A

#### 3.1.1 Display flowchart

Press the "MODE" button once to shift to the next display mode. Refer to section 3.1.2 and later for the description of the corresponding display mode.

| Display mode transition                 | Initial display | Function   | Reference  |

| Extension setting 3<br>parameters       |                 | Display and setting of extension setting 3 parameters.   |  |
| Positioning control parameters          |                 | Display and setting of positioning control parameters.   |  |

Note. When the axis name is set to the servo amplifier using MR Configurator2, the servo status is displayed after the axis name is displayed.

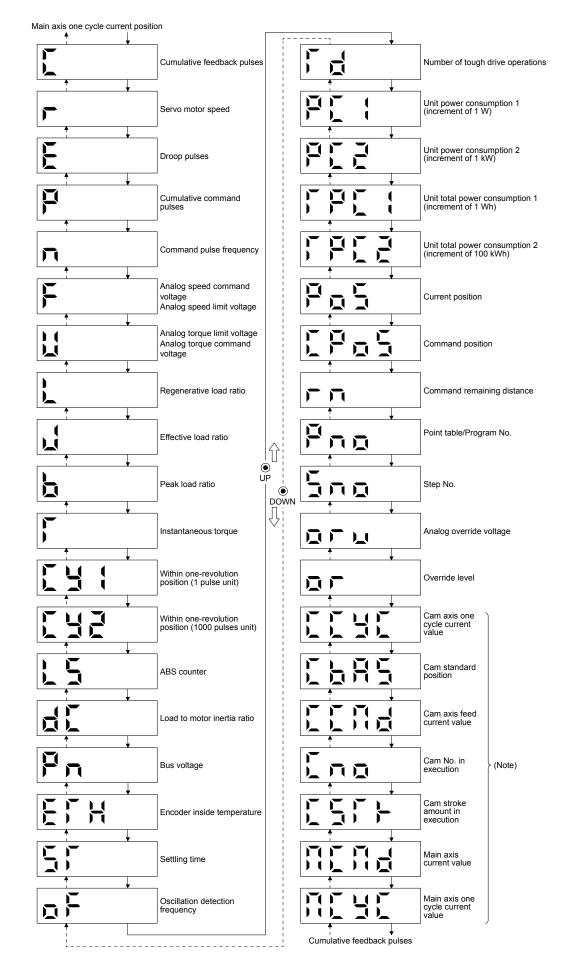

#### 3.1.2 Status display mode

The servo status during operation is shown on the 5-digit, 7-segment LED display. Press the "UP" or "DOWN" button to change the display data as desired. When a servo status is selected, the corresponding symbol is displayed. Press the "SET" button to display its data. However, only when the power is turned on, the data will be displayed after the status symbol selected with [Pr. PC36] is displayed for 2 s.

#### (1) Display transition

After selecting the status display mode with the "MODE" button, pressing the "UP" or "DOWN" button changes the display as follows:

# 3. DISPLAY AND OPERATION SECTIONS

3-4

## (2) Status display list

The following table lists the servo statuses that may be shown.

|  |        |             |  | mo | ntrol<br>ode<br>te 1) |
|--|--------|-------------|--|----|-----------------------|
| Status display   | Symbol | Unit        | Description  | СР | CL                    |
| Cumulative feedback<br>pulses                                    | с      | pulse       | Feedback pulses from the servo motor encoder are counted and displayed.<br>The values in excess of ±99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits.<br>Press the "SET" button to reset the display value to "0".<br>The decimal points in the upper four digits are lit for negative value.        | 0  | 0                     |
| Servo motor speed  | r      | r/min       | The servo motor speed is displayed.<br>It is displayed rounding off 0.1 r/min unit.  | 0  | 0                     |
| Droop pulses   | E      | pulse       | The number of droop pulses in the deviation counter are displayed.<br>The decimal points in the upper four digits are lit for reverse rotation pulses.<br>The values in excess of ±99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits.<br>The number of pulses displayed is in the encoder pulse unit. | 0  | 0                     |
| Cumulative command pulses  | Р      | pulse       | Not used with the positioning mode. "0" is always displayed.   |    | $\overline{\ }$       |
| Command pulse frequency  | n      | kpulse/s    | Not used with the positioning mode. "0" is always displayed.   |    | $\square$             |
| Analog speed command<br>voltage<br>Analog speed limit<br>voltage | F      | V           | Not used with the positioning mode. An applied voltage to the CN1 connector is displayed.  |    | $\backslash$          |
| Analog torque command<br>voltage<br>Analog torque limit          | U      | V           | Not used with the positioning mode. An applied voltage to the CN1 connector is displayed.  |    | $\square$             |
| voltage  |        |             | Voltage of TLA (Analog torque limit) is displayed.   | 0  | 0                     |
| Regenerative load ratio  | L      | %           | The ratio of regenerative power to permissible regenerative power is displayed in %.   | 0  | 0                     |
| Effective load ratio   | J      | %           | The continuous effective load current is displayed.<br>The effective value in the past 15 s is displayed, with the rated<br>current being 100 %.   | 0  | 0                     |
| Peak load ratio  | b      | %           | The maximum torque generated is displayed.<br>The highest value in the past 15 s is displayed, with the rated<br>torque being 100 %.   | 0  | 0                     |
| Instantaneous torque   | т      | %           | The instantaneous torque is displayed.<br>The torque generated is displayed in real time, with the rated<br>torque being 100%.   | 0  | 0                     |
| Within one-revolution position (1 pulse unit)                    | Cy1    | pulse       | Position within one revolution is displayed in encoder pulses. The values in excess of $\pm$ 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits. When the servo motor rotates in the CCW direction, the value is added.  | 0  | 0                     |
| Within one-revolution<br>position (1000 pulse unit)              | Cy2    | 1000 pulses | The within one-revolution position is displayed in 1000 pulse increments of the encoder.<br>When the servo motor rotates in the CCW direction, the value is added.   | 0  | 0                     |
| ABS counter  | LS     | rev         | Travel distance from power on is displayed by counter value.   | 0  | 0                     |
| Load to motor inertia ratio                                      | dC     | Multiplier  | The estimated ratio of the load inertia moment to the servo motor shaft inertia moment is displayed.   | 0  | 0                     |
| Bus voltage  | Pn     | V           | The voltage of main circuit converter (between P+ and N-) is displayed.  | 0  | 0                     |
| Encoder inside temperature                                       | ETh    | °C          | Inside temperature of encoder detected by the encoder is displayed.  | 0  | 0                     |

Note 1. CP: Positioning mode (point table method)

- CL: Positioning mode (program method)
- 2. The unit can be selected from  $\mu\text{m/inch/degree/pulse}$  with [Pr. PT01].
- 3. The unit can be changed with "Cam control data No. 14" to  $\mu\text{m/inch/degree/pulse}.$

#### (3) Changing the status display screen

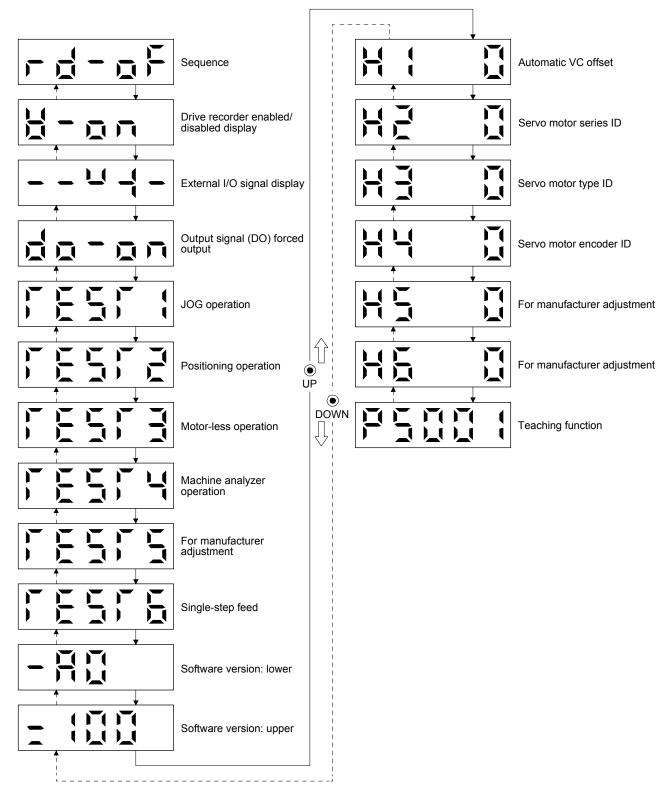

The status display on the servo amplifier at power-on can be changed with [Pr. PC36]. The status displayed by default varies depending on the control mode as follows:

| Control mode                                    | Status display  |
|---|---|
| Position  | Cumulative feedback pulses                                  |
| Position/speed                                  | Cumulative feedback pulses/servo motor speed                |
| Speed   | Servo motor speed   |
| Speed/torque                                    | Servo motor speed/analog torque command voltage             |
| Torque  | Analog torque command voltage                               |
| Torque/position                                 | Analog torque command voltage/cumulative feedback<br>pulses |
| Positioning (point table method/program method) | Current position  |

### 3.1.3 Diagnostic mode

Diagnosis contents can be displayed on the display. Press the "UP" or "DOWN" button to change the display data as desired.

#### (1) Display transition

When using the VC automatic offset, enable it in the following procedures. When it is enabled, [Pr. PC37] value changes to the automatically adjusted offset voltage.</li> <li>1) Press the "SET" button once.</li> <li>2) Set the number in the first digit to "1" with the "UP" button.</li> <li>3) Press the "SET".button. This function cannot be used if the input voltage of VC is - 0.4 V or less, or +0.4 V or more.</li> </ul> |
| Servo motor series ID       |                          | Push the "SET" button to show the series ID of the servo<br>motor currently connected.<br>For indication details, refer to appendix 1 of "HF-KN/HF-SN<br>servo Motor Instruction Manual".  |
| Servo motor type ID         |                          | Push the "SET" button to show the type ID of the servo<br>motor currently connected.<br>For indication details, refer to appendix 1 of "HF-KN/HF-SN<br>servo Motor Instruction Manual".  |
| Servo motor encoder ID      |                          | Push the "SET" button to show the encoder ID of the servo<br>motor currently connected.<br>For indication details, refer to appendix 1 of "HF-KN/HF-SN<br>servo Motor Instruction Manual".   |
| For manufacturer adjustment |                          | This is for manufacturer adjustment.   |
| For manufacturer adjustment |                          | This is for manufacturer adjustment.   |
| Teaching function           | Refer to section 3.1.10. | After an operation travels to a target position (MEND<br>(Travel completion) is turned on) with a JOG operation or<br>manual pulse generator operation, pushing the "SET"<br>button of the operation part or turning on TCH (Teach) will<br>import position data. This function is available only in the<br>point table method. In other control modes, the display<br>remains the same.   |

Note. Even if VC automatic offset is performed and 0 V is inputted, the speed may not completely be the set value.

### 3.1.4 Alarm mode

The current alarm, past alarm history and parameter error are displayed. The lower 2 digits on the display indicate the alarm No. that has occurred or the parameter No. in error.

| Name   | Display (Note 1) | Description   |
|--|------------------|---|
| Current alarm  |                  | Indicates no occurrence of an alarm.  |
|  |                  | Indicates the occurrence of [AL. 33.1 Main circuit voltage error].<br>Flickers at alarm occurrence.   |
|  |                  | Indicates that the last alarm is [AL. 50.1 Thermal overload error 1 during operation].  |
|  |                  | Indicates the second last alarm is [AL. 33.1 Main circuit voltage error].   |
|  |                  | Indicates the third last alarm is [AL. 10.1 Voltage drop in the control circuit power].   |
| Alarm history  |                  | Indicates that there is no tenth alarm in the past.   |
|  |                  | Indicates that there is no eleventh alarm in the past.  |
|  |                  | Indicates that there is no twelfth alarm in the past.   |
|  |                  | I<br>I<br>Indicates that there is no sixteenth alarm in the past.   |
|  |                  | This indicates no occurrence of [AL. 37 Parameter error].   |
|  |                  |   |
| Parameter error No./point<br>table error No.<br>(Note 2) |                  | The data content error of [Pr. PA12 Reverse rotation torque limit].   |
| (((((((((((((((((((((((((((((((((((((((                  |                  | The value of the point table is over the setting range.<br>The error point table No. (intermediate digit "2") and item (lower digit<br>"d") are displayed.<br>The following shows the items.<br>P: position data, d: motor speed, A: acceleration time constant, b:<br>deceleration time constant, n: dwell, H: sub function, M: M code |

Note 1. If a parameter error and point table error occur simultaneously, the display shows the parameter error.

2. The display shows only when the current alarm is [AL. 37 Parameter error].

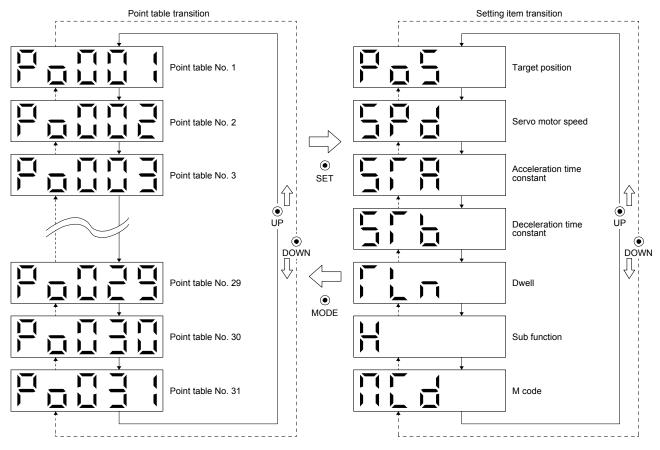

The following is additional information of alarm occurrence:

- (1) The current alarm is displayed in any mode.
- (2) Even during an alarm occurrence, the other display can be viewed by pressing the button in the operation area. At this time, the decimal point in the fourth digit remains flickering.
- (3) Remove the cause of the alarm and clear it in any of the following methods. (Refer to chapter 8 for the alarms that can be cleared.) )
  - (a) Cycle the power.
  - (b) Press the "SET" button on the current alarm display.
  - (c) Turn on RES (Reset).
- (4) Use [Pr. PC18] to clear the alarm history.
- (5) Press the "UP" or "DOWN" button to move to the next history.

#### 3.1.5 Point table setting

You can set the target position, servo motor speed, acceleration time constant, deceleration time constant, dwell, sub function and M code.

#### (1) Display transition

## (2) Setting list

The following point table setting can be displayed.

| Status display             | Symbol | Unit   | Description   | Indication<br>range             |
|----------------------------|--------|--|---|---------------------------------|
| Point table No.            | Po001  |  | Specify the point table to set the target position, servo motor speed,<br>acceleration time constant, deceleration time constant, dwell, sub function<br>and M code.  | 1 to 31                         |
| Target position            | PoS    | 10 <sup>STM</sup> µm<br>10 <sup>(STM-4)</sup> inch<br>10 <sup>-3</sup> degree<br>pulse<br>(Note) | Set the travel distance.  | -999999<br>to<br>999999         |
| Servo motor speed          | SPd    | r/min  | Set the command speed of the servo motor for execution of positioning. The setting value must be within the permissible speed of the servo motor used. If a value equal to or larger than the permissible speed is set, the value will be clamped at the permissible speed.   | 0<br>to<br>Permissible<br>speed |
| Acceleration time constant | STA    | ms   | Set a time for the servo motor to reach the rated speed.  | 0 to 20000                      |
| Deceleration time constant | STb    | ms   | Set a time for the servo motor to stop from the rated speed.  | 0 to 20000                      |
| Dwell                      | TLn    | ms   | This function is enabled when you select the point table by input signal.<br>To disable the dwell, set "0" or "2" to the sub function. To perform a<br>continuous operation, set "1", "3", "8", "9", "10", or "11" to the sub function<br>and 0 to the dwell. When the dwell is set, the position command of the<br>selected point table is completed. After the set dwell has elapsed, start the<br>position command of the next point table.  | 0 to 20000                      |
| Sub function               | н      |  | <ul> <li>This function is enabled when you select the point table by input signal.</li> <li>(1) When using the point table in the absolute value command method</li> <li>0: Executes automatic operation for a selected point table.</li> <li>1: Executes automatic continuous operation without stopping for the next point table.</li> <li>8: Executes automatic continuous operation without stopping for the point table selected at the start.</li> <li>9: Executes automatic continuous operation without stopping for the point table No. 1.</li> <li>(2) When using the point table in the incremental value command method</li> <li>2: Executes automatic operation for a selected point table.</li> <li>3: Executes automatic operation for a selected point table.</li> <li>3: Executes automatic continuous operation without stopping for the next point table.</li> <li>10: Executes automatic continuous operation without stopping for the point table.</li> <li>11: Executes automatic continuous operation without stopping for the next point table.</li> <li>12: Executes automatic continuous operation without stopping for the next point table.</li> <li>13: Executes automatic continuous operation without stopping for the next point table.</li> <li>14: Executes automatic continuous operation without stopping for the point table.</li> <li>15: Executes automatic continuous operation without stopping for the point table.</li> <li>16: Executes automatic continuous operation without stopping for the point table selected at the start.</li> <li>11: Executes automatic continuous operation without stopping for the point table selected at the start.</li> <li>11: Executes automatic continuous operation without stopping for the point table No. 1.</li> <li>When a different rotation direction is set, smoothing zero (command output) is confirmed and then the rotation direction is reversed.</li> <li>When "1" or "3" is set to the point table No. 31, [AL. 61] will occur at the time of point table execution.</li> </ul> | 0 to 3, 8 to 11                 |
| M code                     | MCd    |  | This is the code output at the completion of positioning.<br>This code will be available in the future.<br>Outputs the first digit and the second digit of the M code in 4-bit binary<br>respectively.  | 0 to 99                         |

| Note. | The unit can be selected from µm/inch/degree/pulse with [Pr. PT( | J1]. |
|-------|--|------|
|-------|--|------|

### (3) Operation method

POINT
 After changing and defining the setting values of the specified point table, the defined setting values of the point table are displayed. To discard the changed setting, press the "MODE" button for 2 s or more. The setting before the change will be displayed. Keep pressing the "UP" or "DOWN" button to continuously change the most significant digit of the setting values.

#### (a) Setting of 5 or less digits

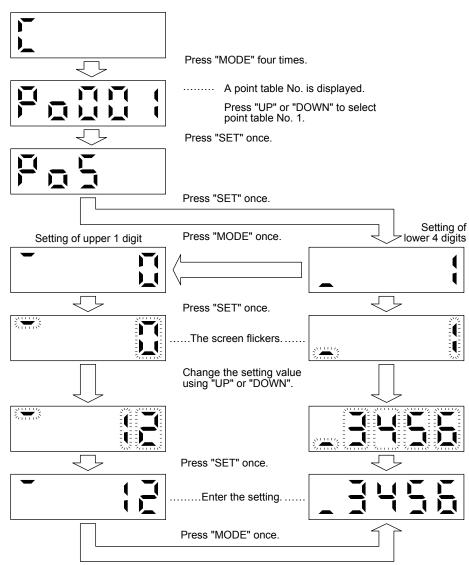

The following example is the operation method at power-on to set "1" to the sub function of the point table No. 1.

|                          | Press "MODE" four times.  |
|--------------------------|---|
|                          | A point table No. is displayed.<br>Press "UP" or "DOWN" to select<br>point table No. 1. |
| $\bigtriangledown$       | Press "SET" once.   |
|                          | Press "UP" five times.  |
|                          | Press "SET" twice.  |
|                          | The setting value of the sub function of the specified point table No. flickers.        |
| $\bigtriangledown$       | Press "UP" once.  |
|                          | During flickering, the set value can be changed.  |
|                          | Set the value using "UP" or "DOWN".   |
|                          | Press "SET" to enter.   |
| To the next item setting |   |

Press the "UP" or "DOWN" button to switch to other item of the same point table No. Press the "MODE" button to switch to the next point table No.

#### (b) Setting of 6 or more digits

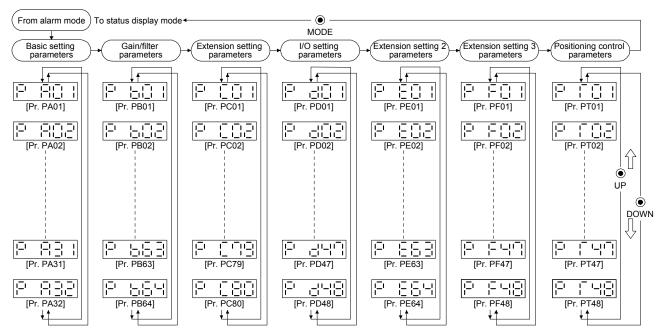

The following example is the operation method to change the position data of the point table No. 1 to "123456".

#### 3.1.6 Parameter mode

#### (1) Parameter mode transition

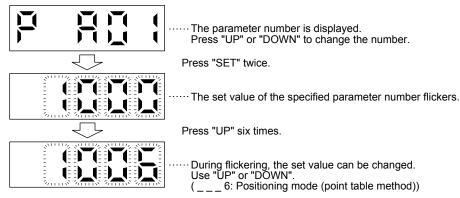

After selecting the corresponding parameter mode with the "MODE" button, pressing the "UP" or "DOWN" button changes the display as shown below.

(2) Operation method

(a) Parameters of 5 or less digits

The following example shows the operation procedure performed after power-on to change the control mode to the positioning mode (point table method) with [Pr. PA01 Operation mode]. Press "MODE" to switch to the basic setting parameter display.

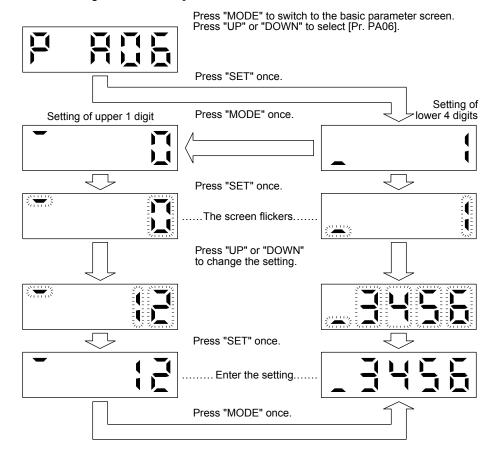

To decide the value , press "SET".

To shift to the next parameter, press the "UP" or "DOWN" button. After changing [Pr. PA01], cycle the power to enable the setting.

#### (b) Parameters of 6 or more digits

The following example gives the operation procedure to change the electronic gear numerator to "123456" with [Pr. PA06 Electronic gear numerator].

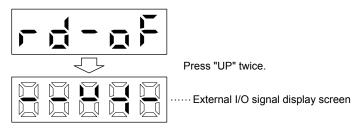

### 3.1.7 External I/O signal display

| POINT                     |  |
|---------------------------|--|
| The I/O sign to [Pr. PD28 | al settings can be changed using I/O setting parameters [Pr. PD04]<br>]. |

The on/off states of the digital I/O signals connected to the servo amplifier can be confirmed.

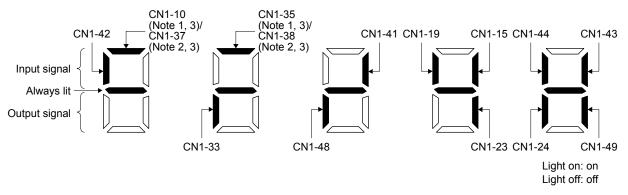

### (1) Operation

The display at power-on. Switch to the diagnostic display with the "MODE" button.

#### (2) Display definition

The 7-segment LED segments and CN1 connector pins correspond as shown below.

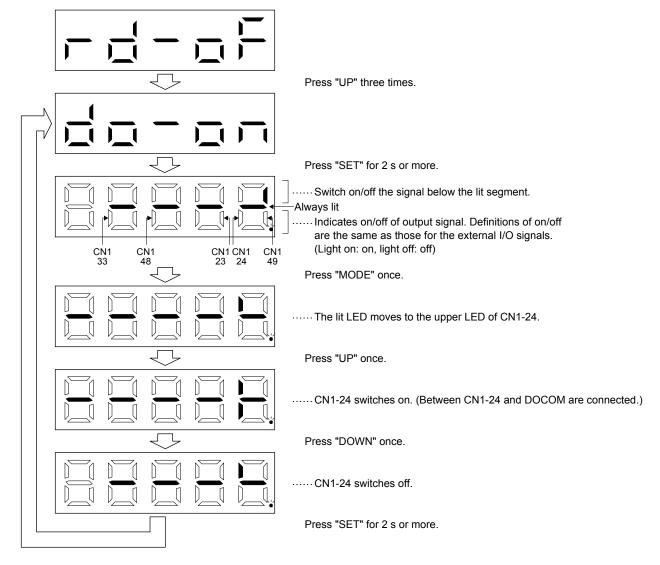

The LED segment corresponding to the pin is lit to indicate on, and is extinguished to indicate off. For each pin signal in control modes, refer to section 2.2.

#### 3.1.8 Output signal (DO) forced output

| POINT   |  |  |  |  |
|---|--|--|--|--|
| ●When the servo system is used in a vertical lift application, turning on MBR   |  |  |  |  |
| (Electromagnetic brake interlock) by the DO forced output after assigning it to |  |  |  |  |
| connector CN1 will release the electromagnetic brake, causing a drop. Take      |  |  |  |  |
| drop preventive measures on the machine side.                                   |  |  |  |  |

Output signals can be switched on/off forcibly independently of the servo status. This function can be used for output signal wiring check, etc. This operation must be performed in the servo off state by turning off SON (Servo-on).

The display screen at power-on. Switch to the diagnostic display with the "MODE" button.

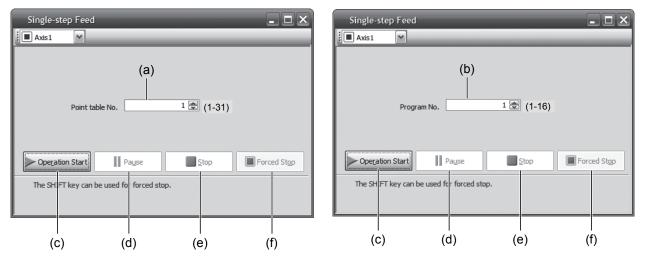

#### 3.1.9 Single-step feed

| The test operation mode is designed for checking servo operation. Do not use it for actual operation.<br>If the servo motor operates unexpectedly, use EM2 (Forced stop 2) to stop it. |
|--|
| POINT<br>●MR Configurator2 is required to perform single-step feed.  |

Test operation cannot be performed if SON (Servo-on) is not turned off.

The positioning operation can be performed in accordance with the point table No. or the program No. set by MR Configurator2.

Select the test operation/single-step feed from the menu of MR Configurator2. When the single-step feed window is displayed, input the following items and operate.

Point table operation

Program operation

(1) Point table No. or program No. setting

Enter a point table No. in the input box (a) "Point table No.", or a program No. in the input box (b) "Program No.".

(2) Forward/reverse the servo motor

Click "Operation Start" button (c) to rotate the servo motor.

(3) Pause the servo motor

Click "Pause" button (d) to temporarily stop the servo motor.

While the servo motor is temporarily stopped, click the "Operation Start" button (c) to restart the rotation of the remaining travel distance.

While the servo motor is temporarily stopped, click the "Stop" button (e) to clear the remaining travel distance.

(4) Stop the servo motor

Click the "Stop" button (e) to stop the servo motor. At this time, the remaining travel distance will be cleared. Click the "Operation Start" (c) button to restart the rotation.

(5) Forced stop of the servo motor software

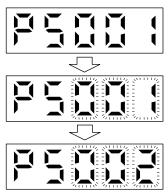

Click the "Forced Stop" (f) button to make an instantaneous stop. When the "Forced Stop" button is enabled, the "Operation Start" button cannot be used. Click the "Forced Stop" button again to enable the "Operation Start" button.

(6) Switch to the normal operation modeBefore switching from the test operation mode to the normal operation mode, turn off the servo amplifier.

# 3.1.10 Teaching function

After an operation travels to a target position (MEND (Travel completion) is turned on) with a JOG operation or manual pulse generator operation, pushing the "SET" button of the operation area or turning on TCH (Teach) will import the position data. This function is available only in the point table method. In other control modes, the display remains the same.

# (1) Teaching preparation

Teaching setting initial display

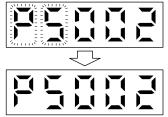

Press the "SET" button for approximately 2 s to switch to the teaching setting mode.

When the lower three digits flicker, press the "UP" or "DOWN" button to select the point table.

When the lower three digits flicker, press the "SET" button to complete the teaching setting preparation. The upper two digits on the display will flicker on completion of proper preparation

(2) Position data setting method

After an operation travels to a target position (MEND (Travel completion) is turned on) with a JOG operation or manual pulse generator operation, pushing the "SET" button of the operation part or turning on TCH (Teach) will set the positioning address as position data.

When the upper two digits flicker, the current position is written to the selected point table by pressing the "SET" button.

When the upper two digits or the lower two digits flicker, the display returns to the teaching setting initial screen by pressing the "MODE" button.

The following shows the conditions for when the teaching function operates.

- (a) When the "positioning command method" of [Pr. PT01] is set to absolute value command method (\_ \_ \_ 0)
- (b) Home position return completion (ZP (Home position return completion) is turned on)
- (c) While the servo motor is stopped (command output = 0, MEND (Travel completion) is turned on)

# 4. HOW TO USE THE POINT TABLE

For the details of the following items, refer to chapter/section (of "MR-JE-\_A Servo Amplifier Instruction Manual") indicated in the table.

| Item                                  | Detailed explanation |  |
|---------------------------------------|----------------------|--|
| item                                  | MR-JEA               |  |
| Switching power on for the first time | Section 4.1          |  |

# POINT

For the mark detection function (Current position latch), refer to section 6.2.2.
For the mark detection function (Interrupt positioning), refer to section 6.2.3.

# 4.1 Startup

4.1.1 Power on and off procedures

When the servo amplifier is powered on for the first time, the control mode is set to position control mode. (Refer to section 4.2.1 of "MR-JE-\_A Servo Amplifier Instruction Manual".)

This section provides a case where the servo amplifier is powered on after setting the positioning mode.

(1) Power-on

Switch the power on in the following procedure. Always follow this procedure at power-on.

- 1) Switch off SON (Servo-on).
- 2) Make sure that ST1 (Forward rotation start) and ST2 (Reverse rotation start) are off.
- Switch on the main circuit power supply and the control circuit power supply. The display shows "Pos" and 2 s later shows data.

(2) Power-off

- 1) Switch off ST1 (Forward rotation start) and ST2 (Reverse rotation start).
- 2) Switch off SON (Servo-on).
- 3) Switch off the main circuit power supply and the control circuit power supply.

#### 4.1.2 Stop

If any of the following situations occurs, the servo amplifier suspends and stops the operation of the servo motor.

Refer to section 3.10 of "MR-JE-\_A Servo Amplifier Instruction Manual" for the servo motor with an electromagnetic brake.

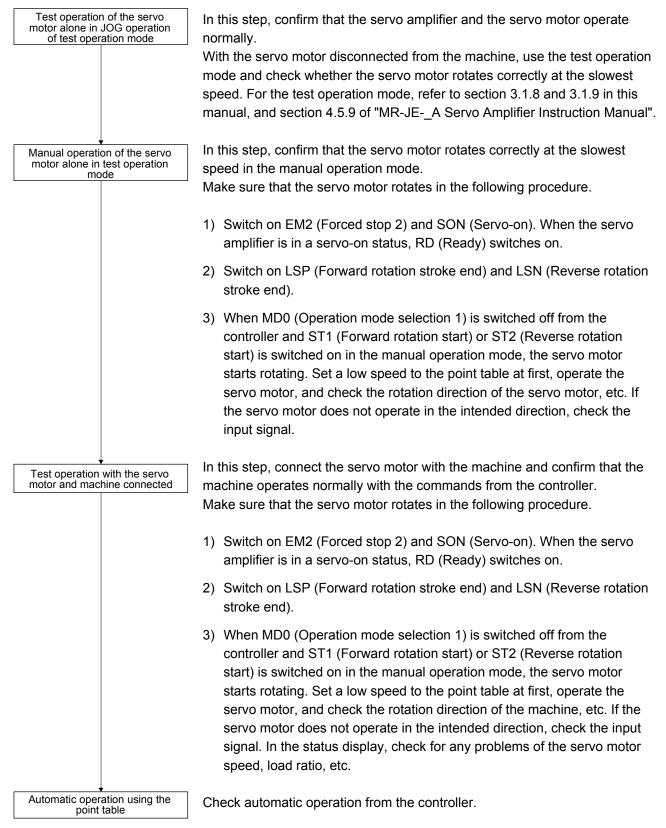

| Operation/command  | Stopping condition   |
|--|--|
| Switch off SON (Servo-on).   | The base circuit is shut off, and the servo motor coasts.  |
| Alarm occurrence   | The servo motor decelerates to a stop. With some alarms; however, the dynamic brake operates to stop the servo motor. (Refer to chapter 8. (Note)) |
| EM2 (Forced stop 2) off  | The servo motor decelerates to a stop with the command. [AL. E6 Servo forced stop warning] occurs. Refer to section 2.3 for EM1.                   |
| LSP (Forward rotation stroke end) off or LSN (Reverse rotation stroke end) off | The servo motor stops immediately and will be servo locked. Operation in the opposite direction is possible.                                       |

Note. Only a list of alarms and warnings is listed in chapter 8. Refer to "MELSERVO-JE Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

# 4.1.3 Test operation

Before starting an actual operation, perform a test operation to make sure that the machine operates normally.

Refer to section 4.1 for how to power on and off the servo amplifier.

# 4.1.4 Parameter setting

| POINT  |
|--|
| ●The following encoder cables are of four-wire type. When using any of these   |
| encoder cables, set [Pr. PC22] to "1 " to select the four-wire type. Incorrect |
| setting will result in [AL. 16 Encoder initial communication error 1].         |
| MR-EKCBL30M-L  |
| MR-EKCBL30M-H  |
| MR-EKCBL40M-H  |
| MR-EKCBL50M-H  |

When you use the servo in the point table method, set [Pr. PA01] to "\_\_\_6" (Positioning mode (point table method)). In the point table method, the servo can be used by merely changing the basic setting parameters ([Pr. PA\_\_]) and the positioning control parameters ([Pr. PT\_\_]) mainly.

As necessary, set other parameters.

The following table shows the necessary setting of [Pr. PA \_ ] and [Pr. PT \_ ] in the point table method.

|                            | Parameter setting Input device setting                           |   | device setting |              |                 |  |
|----------------------------|--|---|----------------|--------------|-----------------|--|
| Operation mode             |  |   | [Pr. PA01]     | [Pr. PT04]   | MD0<br>(Note 1) | DI0 to DI4<br>(Note 1, 2)                |
|                            | Each position  | ng operation  |                | $\backslash$ |                 |  |
| Automatic operation        | Automatic  | Varying-speed operation                             |                |              |                 | Set the point table                      |
| mode in point table method | continuous<br>operation  | Automatic<br>continuous<br>positioning<br>operation |                |              | On              | No. (Refer to section<br>4.2.1 (2) (b).) |
| Manual operation           | JOG operation  | ו   |                |              |                 |  |
| mode                       | Manual pulse generator operation                                 |   | 6              |              | Off             |  |
|                            | Dog type   |   |                | 0            | On              | All off                                  |
|                            | Count type   |   |                | 1            |                 |  |
|                            | Data set type  |   |                | 2            |                 |  |
|                            | Stopper type   |   |                | 3            |                 |  |
| Home position return       | Home position ignorance (servo-<br>on position as home position) |   |                | 4            |                 |  |
| mode                       | Dog type rear end reference                                      |   |                | 5            |                 |  |
|                            | Count type front end reference                                   |   |                | 6            |                 |  |
|                            | Dog cradle type  |   |                | 7            |                 |  |
|                            | Dog type last Z-phase reference                                  |   |                | 8            |                 |  |
|                            | Dog type front end reference                                     |   |                | 9            |                 |  |
|                            | Dogless Z-pha  | ase reference                                       |                | A            |                 |  |

Note 1. MD0: Operation mode selection 1, DI0 to DI4: Point table No. selection 1 to Point table No. selection 52. DI4 is available only with the communication function. This device cannot be assigned as an input signal.

# 4.1.5 Point table setting

Set the data for operation to the point table. The following shows the items to be set.

| Item                          | Main description  |  |
|-------------------------------|---|--|
| Position data                 | Set the position data for movement.   |  |
| Servo motor<br>speed          | Set the command speed of the servo motor for execution of positioning.  |  |
| Acceleration time constant    | Set the acceleration time constant.   |  |
| Deceleration<br>time constant | Set the deceleration time constant.   |  |
| Dwell                         | Set the waiting time when performing automatic continuous operation.  |  |
| Sub function                  | Set when performing automatic continuous operation.   |  |
| M code                        | The first digit and the second digit of the M code are outputted in 4-bit binary respectively.<br>M code will be available in the future. |  |

Refer to section 4.2.2 for details of the point table.

# 4.1.6 Actual operation

Start actual operation after confirmation of normal operation by test operation and completion of the corresponding parameter settings.

# 4.1.7 Troubleshooting at start-up

•Never make a drastic adjustment or change to the parameter values as doing so CAUTION will make the operation unstable.

● Using MR Configurator2, you can refer to the reason for rotation failure, etc.

The following faults may occur at start-up. If any of such faults occurs, take the corresponding action. "MR-JE-\_A" means "MR-JE-\_A Servo Amplifier Instruction Manual".

| No. | Start-up sequence         | Fault  | Investigation  | Possible cause   | Reference           |

Note. Only a list of alarms and warnings is listed in chapter 8. Refer to "MELSERVO-JE Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

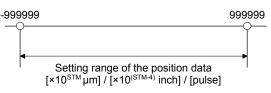

- 4.2 Automatic operation mode
- 4.2.1 Automatic operation mode
- (1) Command method

Set point tables in advance, and select any point table by using an input signal or RS-422/RS-485 communication. Start the operation using ST1 (Forward rotation start) or ST2 (Reverse rotation start). Absolute value command method and incremental value command method are available in automatic operation mode.

(a) Absolute value command method

As position data, set the target address to be reached.

- 1) mm, inch, and pulse unit
  - Setting range: -999999 to 9999999 [×10<sup>STM</sup> μm] (STM = Feed length multiplication [Pr. PT03]) -999999 to 9999999 [×10<sup>(STM-4)</sup> inch] (STM = Feed length multiplication [Pr. PT03]) -999999 to 9999999 [pulse]

2) Degree unit

90 (-270)

Set the target position by indicating the CCW direction with a "+" sign and the CW direction with a "-" sign.

In the absolute value command method, the rotation direction can be specified with a "+" or "-" sign.

An example of setting is shown below.

0 (-360)

Setting range of the

position data

[degree]

180 (-180) Coordinate system in degrees

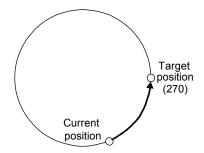

- The coordinate is determined by referring to the position of 0 degree.
- + direction:  $0 \rightarrow 90 \rightarrow 180 \rightarrow 270 \rightarrow 0$
- direction: 0  $\rightarrow$  -90  $\rightarrow$  -180  $\rightarrow$  -270  $\rightarrow$  -360
- The positions of 270 degrees and -90 degrees are the same.
- The positions of 0 degree, 360 degrees and -360 degrees are the same.

The travel direction to the target position is set with [Pr. PT03].

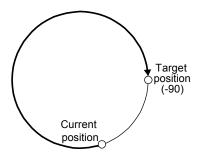

, 270 (-90)

| [Pr. PT03] setting | Servo motor rotation direction  |
|--------------------|---|
| _0                 | The servo motor rotates to the target position in a direction specified with a sign of the position data.   |
| _1                 | The servo motor rotates from the current position to the target position in the shorter direction. If the distances from the current position to the target position are the same for CCW and CW, the servo motor rotates in the CCW direction. |

a) When using the Rotation direction specifying ([Pr. PT03] = "\_ 0 \_ \_") When the position data of 270.000 degrees is specified, the servo motor rotates in the CCW direction.

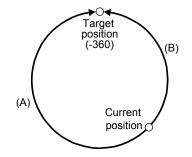

When the position data of -90.000 degrees is specified, the servo motor rotates in the CW direction.

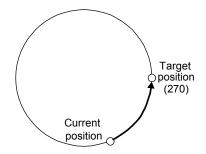

When the position data of -360.000 degrees is specified, the servo motor rotates in the CW direction. (A)

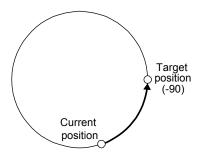

When the position data of 360.000 degrees or 0 degree is specified, the servo motor rotates in the CCW direction. (B)

 b) When using the shortest rotation specification ( [Pr. PT03] = \_ 1 \_ \_) When the position data of 270.000 degrees is specified, the servo motor rotates in the CCW direction.

When the position data of -90.000 degrees is specified, the servo motor rotates in the CCW direction.

If the position data of 270.000 degrees is specified when the current position is at 90, the distances in the CCW and CW are the same. In such a case, the servo motor rotates in the CCW direction.

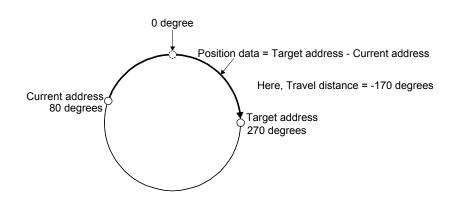

# (b) Incremental value command method As position data, set the travel distance from the current address to the target address.

1) mm, inch, and pulse unit

Setting range: 0 to 9999999 [×10<sup>STM</sup> µm] (STM = Feed length multiplication [Pr. PT03]) -999999 to 9999999 [×10<sup>(STM-4)</sup> inch] (STM = Feed length multiplication [Pr. PT03]) -999999 to 9999999 [pulse]

2) Degree unit

# (2) Point table

(a) Point table setting

1 to 31 point tables can be set. To use point table No. 4 to 31, enable DI2 (Point table No. selection 3) to DI4 (Point table No. selection 5) with "Device Setting" on MR Configurator2.

Set point tables using MR Configurator2 or the operation section of the servo amplifier.

The following table lists what to set. Refer to section 4.2.2 for details of the settings.

| Item                       | Main description  |  |  |  |
|----------------------------|---|--|--|--|
| Position data              | Set the position data for movement.   |  |  |  |
| Servo motor<br>speed       | Set the command speed of the servo motor for execution of positioning.  |  |  |  |
| Acceleration time constant | Set the acceleration time constant.   |  |  |  |
| Deceleration time constant | Set the deceleration time constant.   |  |  |  |
| Dwell                      | Set the waiting time when performing automatic continuous operation.  |  |  |  |
| Sub function               | Set when performing automatic continuous operation.   |  |  |  |
| M code                     | The first digit and the second digit of the M code are outputted in 4-bit binary respectively.<br>M code will be available in the future. |  |  |  |

(b) Selection of point tables

Using the input signal or the communication function, select the point table No. with the communication command from the controller such as a personal computer.

The following table lists the point table No. selected in response to the input signal and the communication command.

However, when using the input signal to select the point table No., you can only use point table No. 1 to 3 in the initial status.

To use point table No. 4 to 31, enable DI2 (Point table No. selection 3) to DI4 (Point table No. selection 5) with "Device Setting" on MR Configurator2.

When using the communication function to select the point table No., refer to chapter 10.

|                 | Input signal (Note 1) |     |     |     |                              |
|-----------------|-----------------------|-----|-----|-----|------------------------------|
| DI4<br>(Note 2) | DI3                   | DI2 | DI1 | DI0 | Selected point table No.     |
| 0               | 0                     | 0   | 0   | 0   | 0 (for home position return) |
| 0               | 0                     | 0   | 0   | 1   | 1                            |
| 0               | 0                     | 0   | 1   | 0   | 2                            |
| 0               | 0                     | 0   | 1   | 1   | 3                            |
| 0               | 0                     | 1   | 0   | 0   | 4                            |
| -               | •                     | •   |     | •   | •                            |
| -               |                       |     | •   | •   | •                            |
| -               |                       |     | -   |     | •                            |
| 1               | 1                     | 1   | 1   | 0   | 30                           |
| 1               | 1                     | 1   | 1   | 1   | 31                           |

Note 1. 0: Off

1: On

2. DI4 is available only with the communication function. This device cannot be assigned as an input signal.

- 4.2.2 Automatic operation using point table
- (1) Absolute value command method

This method allows to select absolute value command or incremental value command with the sub function of the point table.

(a) Point table

Set the point table values using MR Configurator2 or the operation section.

Set the position data, servo motor speed, acceleration time constant, deceleration time constant, dwell, sub function, and M code to the point table.

To use the point table with the absolute value command method, set "0", "1", "8", or "9" to the sub function. To use the point table with the incremental value command method, set "2", "3", "10", or "11" to the sub function.

When you set a value outside the setting range to the point table, the set value will be clamped with the maximum or minimum value. If the value becomes out of the range because of the changes in the command unit or the connected servo motor, [AL. 37] will occur.

| Item                       | Setting range               | Unit  | Description   |  |
|----------------------------|-----------------------------|---|---|--|
| Position data              | -999999 to 999999<br>(Note) | 10 <sup>STM</sup> ,µm<br>10 <sup>(STM-4)</sup> inch<br>10 <sup>-3</sup> degree<br>pulse<br>(Note 2) | <ul> <li>(1) When using this point table with the absolute value command method<br/>Set the target address (absolute value).<br/>The teaching function is also available for setting this value.</li> <li>(2) When using this point table with the incremental value command metho<br/>Set the travel distance. A "-" sign indicates a reverse rotation command<br/>The teaching function is not available. When teaching is executed, the<br/>setting will not be completed.</li> </ul>  |  |
| Servo motor speed          | 0 to permissible speed      | r/min   | Set the command speed of the servo motor for execution of positioning.<br>The setting value must be the permissible instantaneous speed or less of the<br>servo motor used.   |  |
| Acceleration time constant | 0 to 20000                  | ms  | Set a time for the servo motor to reach the rated speed.  |  |
| Deceleration time constant | 0 to 20000                  | ms  | Set a time for the servo motor to stop from the rated speed.  |  |
| Dwell                      | 0 to 20000                  | ms  | Set the dwell.<br>To disable the dwell, set "0" or "2" to the sub function.<br>To perform a continuous operation, set "1", "3", "8", "9", "10", or "11" to the<br>sub function and "0" to the dwell.<br>When the dwell is set, a positioning of the next point table will be started after<br>the positioning of the selected data is completed, and the set dwell has<br>elapsed.  |  |
| Sub function               | 0 to 3, 8 to 11             |   | <ul> <li>Set the sub function.</li> <li>(1) When using this point table with the absolute value command method</li> <li>0: Executes automatic operation for a selected point table.</li> <li>1: Executes automatic continuous operation without stopping for the next point table.</li> <li>8: Executes automatic continuous operation without stopping for the point table selected at the start.</li> <li>9: Executes automatic continuous operation without stopping for the point table No. 1.</li> <li>(2) When using this point table with the incremental value command method</li> <li>2: Executes automatic operation for a selected point table.</li> <li>3: Executes automatic continuous operation without stopping for the next point table.</li> <li>10: Executes automatic continuous operation without stopping for the point table selected at the start.</li> <li>11: Executes automatic continuous operation without stopping for the point table selected at the start.</li> <li>11: Executes automatic continuous operation without stopping for the point table No. 1.</li> <li>When an opposite rotation direction is set, the servo motor rotates in the opposite direction after smoothing zero (command output) is confirmed.</li> <li>Setting "1" or "3" to point table No. 31 results in an error.</li> <li>For details, refer to (3) (b) of this section.</li> </ul> |  |
| M code                     | 0 to 99                     |   | Outputs the first digit and the second digit of the M code in 4-bit binary respectively.<br>M code will be available in the future.   |  |

Note. The setting range of the position data in degrees is -360.000 to 360.000. When the unit of the position data is µm or inch, the location of the decimal point is changed according to the STM setting.

# (b) Parameter setting

Set the following parameters to perform automatic operation.

 Command method selection ([Pr. PT01]) Select the absolute value command method as shown below.

Absolute value command method

 Rotation direction selection ([Pr. PA14]) Select the servo motor rotation direction when ST1 (Forward rotation start) is switched on.

| [Pr. PA14] setting | Servo motor rotation direction when ST1 (Forward rotation start) is switched on |
|--------------------|---|
| 0                  | CCW rotation with + position data<br>CW rotation with - position data           |
| 1                  | CW rotation with + position data<br>CCW rotation with - position data           |

 Position data unit ([Pr. PT01]) Set the unit of the position data.

| [Pr. PT01] setting | Position data unit |  |  |
|--------------------|--------------------|--|--|
| _0                 | mm                 |  |  |
| _1                 | inch               |  |  |
| _2                 | degree             |  |  |
| _3                 | pulse              |  |  |

Feed length multiplication ([Pr. PT03])
 Set the feed length multiplication factor (STM) of the position data.

| [Dr. DT02] potting | Position data input range |                        |                        |                      |  |  |
|--------------------|---------------------------|------------------------|------------------------|----------------------|--|--|
| [Pr. PT03] setting | [mm]                      | [inch]                 | [degree] (Note 1)      | [pulse] (Note 1)     |  |  |
| 0                  | - 999.999 to + 999.999    | - 99.9999 to + 99.9999 |                        |                      |  |  |
| 1                  | - 9999.99 to + 9999.99    | - 999.999 to + 999.999 | - 360.000 to + 360.000 | - 999999 to + 999999 |  |  |
| 2                  | - 99999.9 to + 99999.9    | - 9999.99 to + 9999.99 | (Note 2)               | - 333333 10 + 999999 |  |  |
| 3                  | - 999999 to + 999999      | - 99999.9 to + 99999.9 |                        |                      |  |  |

Note 1. The feed length multiplication setting ([Pr. PT03]) is not applied to the unit multiplication factor.

Adjust the unit multiplication factor in the electronic gear setting ([Pr. PA06] and [Pr. PA07]).

2. The "-" sign has different meanings under the absolute value command method and the incremental value command method. Refer to section 4.2.1 for details.

# (c) Operation

Selecting DI0 to DI4 for the point table and switching on ST1 starts positioning to the position data at the set speed, acceleration time constant and deceleration time constant. At this time, ST2 (Reverse rotation start) is disabled.

| Item                               | Device to be used                 | Setting                         |  |
|------------------------------------|-----------------------------------|---------------------------------|--|
| Automatic operation mode selection | MD0 (Operation mode selection 1)  | Switch on MD0.                  |  |
|                                    | DI0 (Point table No. selection 1) |                                 |  |
|                                    | DI1 (Point table No. selection 2) | Refer to section 4.2.1 (2) (b). |  |
| Point table selection              | DI2 (Point table No. selection 3) |                                 |  |
|                                    | DI3 (Point table No. selection 4) |                                 |  |
|                                    | DI4 (Point table No. selection 5) |                                 |  |
| Start                              | ST1 (Forward rotation start)      | Switch on ST1 to start.         |  |

#### (2) Incremental value command method

(a) Point table

Set the point table values using MR Configurator2 or the operation section.

Set the position data, servo motor speed, acceleration time constant, deceleration time constant, dwell, sub function, and M code to the point table.

When you set a value outside the setting range to the point table, the set value will be clamped with the maximum or minimum value. If the value becomes out of the range because of the changes in the command unit or the connected servo motor, [AL. 37] will occur.

| Item                       | Setting range          | Unit  | Description   |
|----------------------------|------------------------|-------|---|
| Position data              | 0 to 999999 (Note)     |       | Set the travel distance.<br>The teaching function is not available. When teaching is executed, the setting will not be completed.<br>The unit can be changed by [Pr. PT03] (Feed length multiplication).  |
| Servo motor<br>speed       | 0 to permissible speed | r/min | Set the command speed of the servo motor for execution of positioning.<br>The setting value must be the permissible instantaneous speed or less of the<br>servo motor used.   |
| Acceleration time constant | 0 to 20000             | ms    | Set a time for the servo motor to reach the rated speed.  |
| Deceleration time constant | 0 to 20000             | ms    | Set a time for the servo motor to stop from the rated speed.  |
| Dwell                      | 0 to 20000             | ms    | Set the dwell.<br>To disable the dwell, set "0" to the sub function.<br>To perform a continuous operation, set "1", "8" or "9" to the sub function and<br>"0" to the dwell.<br>When the dwell is set, a positioning of the next point table will be started after<br>the positioning of the selected data is completed, and the set dwell has<br>elapsed.   |
| Sub function               | 0, 1, 8, 9             |       | <ul> <li>Set the sub function.</li> <li>0: Executes automatic operation for a selected point table.</li> <li>1: Executes automatic continuous operation without stopping for the next point table.</li> <li>8: Executes automatic continuous operation without stopping for the point table selected at the start.</li> <li>9: Executes automatic continuous operation without stopping for the point table No. 1.</li> <li>Setting "1" to point table No. 31 results in an error.</li> <li>For details, refer to (3) (b) of this section.</li> </ul> |
| M code                     | 0 to 99                |       | Outputs the first digit and the second digit of the M code in 4-bit binary respectively.<br>M code will be available in the future.   |

Note. The setting range of the position data in degrees is 0 to 999.999. When the unit of the position data is µm or inch, the location of the decimal point is changed according to the STM setting.

## (b) Parameter setting

Set the following parameters to perform automatic operation.

1) Command method selection ([Pr. PT01])

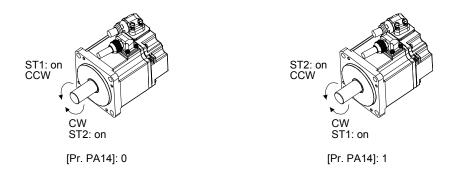

Select the incremental value command method as shown below.

Incremental value command method

 Rotation direction selection ([Pr. PA14]) Select the servo motor rotation direction when ST1 (Forward rotation start) or ST2 (Reverse rotation start) is switched on.

| [Dr. DA14] cotting               | Servo motor rotation direction  |                                 |  |
|----------------------------------|---------------------------------|---------------------------------|--|
| [Pr. PA14] setting               | ST1 (Forward rotation start)    | ST2 (Reverse rotation start)    |  |
| 0                                | CCW rotation (address increase) | CW rotation (address decrease)  |  |
| 1 CW rotation (address increase) |                                 | CCW rotation (address decrease) |  |

 Position data unit ([Pr. PT01]) Set the unit of the position data.

| [Pr. PT01] setting | Position data unit |  |  |
|--------------------|--------------------|--|--|
| _0                 | mm                 |  |  |
| _1                 | inch               |  |  |
| _2                 | degree             |  |  |
| _3                 | pulse              |  |  |

 Feed length multiplication ([Pr. PT03]) Set the feed length multiplication factor (STM) of the position data.

| [Pr. PT03] sotting | Position data input range |                |                 |                |  |  |
|--------------------|---------------------------|----------------|-----------------|----------------|--|--|
| [Pr. PT03] setting | [mm]                      | [inch]         | [degree] (Note) | [pulse] (Note) |  |  |
| 0                  | 0 to + 999.999            | 0 to + 99.9999 |                 |                |  |  |
| 1                  | 0 to + 9999.99            | 0 to + 999.999 | 0 to + 999.999  | 0 to + 999999  |  |  |
| 2                  | 0 to + 99999.9            | 0 to + 9999.99 | 0 10 + 999.999  | 010+999999     |  |  |
| 3                  | 0 to + 999999             | 0 to + 99999.9 |                 |                |  |  |

Note. The feed length multiplication setting ([Pr. PT03]) is not applied to the unit multiplication factor. Adjust the unit multiplication factor in the electronic gear setting ([Pr. PA06] and [Pr. PA07]).

# (c) Operation

Selecting DI0 to DI4 for the point table and switching on ST1 starts a forward rotation of the motor over the travel distance of the position data at the set speed, acceleration time constant and deceleration time constant.

Switching on ST2 starts a reverse rotation of the motor in accordance with the values set to the selected point table.

When the positioning operation is performed consecutively with the incremental value command method, the servo motor rotates in the same direction only.

To change the travel direction during the continuous operation, perform the operation with the absolute value command method.

| Item                               | Device to be used                 | Setting                         |  |
|------------------------------------|-----------------------------------|---------------------------------|--|
| Automatic operation mode selection | MD0 (Operation mode selection 1)  | Switch on MD0.                  |  |
|                                    | DI0 (Point table No. selection 1) |                                 |  |
|                                    | DI1 (Point table No. selection 2) |                                 |  |
| Point table selection              | DI2 (Point table No. selection 3) | Refer to section 4.2.1 (2) (b). |  |
|                                    | DI3 (Point table No. selection 4) |                                 |  |
|                                    | DI4 (Point table No. selection 5) |                                 |  |
| Start                              | ST1 (Forward rotation start)      | Switch on ST1 to start.         |  |
| Start                              | ST2 (Reverse rotation start)      | Switch on ST2 to start.         |  |

## (3) Automatic operation timing chart

- (a) Automatic individual positioning operation
  - 1) Absolute value command method ([Pr. PT01] = \_ \_ 0)

While the servo motor is stopped under servo-on state, switching on ST1 (Forward rotation start) starts the automatic positioning operation.

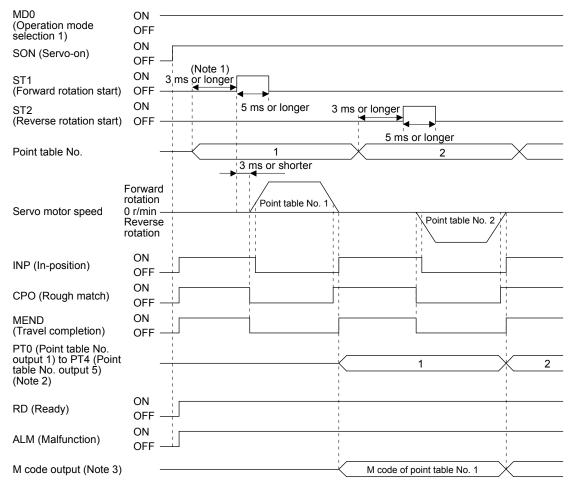

The following shows a timing chart.

| MD0<br>(Operation mode<br>selection 1)   | ONOFF   |   |
|--|---|---|
| SON (Servo-on)   | ON<br>OFF (Note 1)                            |   |
| ST1<br>(Forward rotation start)  | ON 3 ms or longer                             |   |
| ST2<br>(Reverse rotation start)  | ON 5 ms or longer 5 ms or longer<br>OFF       |   |
| Point table No.  | 3 ms or shorter                               |   |
| Servo motor speed  | orward<br>tation<br>r/min<br>everse<br>tation |   |
| INP (In-position)  | ON<br>OFF                                     |   |
| CPO (Rough match)  | ON OFF  |   |
| MEND<br>(Travel completion)  | ON<br>OFF                                     |   |
| PT0 (Point table No.<br>output 1) to PT4 (Point<br>table No. output 5)<br>(Note 2) |   | 2 |
| RD (Ready)   | ON<br>OFF                                     |   |
| ALM (Malfunction)  | ON<br>OFF                                     |   |
| M code output (Note 3)   | M code of point table No. 1                   | _ |

- Note 1. The detection of external input signals is delayed by the set time in the input filter setting of [Pr. PD29]. Considering the output signal sequence from the controller and signal variations due to hardware, configure a sequence that changes the point table selection earlier.
  - 2. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.
  - 3. M code will be available in the future.

2) Absolute value command method ([Pr. PT01] = \_ \_ 1)
 While the servo motor is stopped under servo-on state, switching on ST1 (Forward rotation start) or ST2 (Reverse rotation start) starts the automatic positioning operation.

The following shows a timing chart.

- Note 1. The detection of external input signals is delayed by the set time in the input filter setting of [Pr. PD29]. Considering the output signal sequence from the controller and signal variations due to hardware, configure a sequence that changes the point table selection earlier.
  - 2. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.
  - 3. M code will be available in the future.

(b) Automatic continuous positioning operation

By merely selecting a point table and switching on ST1 (Forward rotation start) or ST2 (Reverse rotation start), the operation can be performed in accordance with the point tables having consecutive numbers.

Absolute value command method ([Pr. PT01] = \_ \_ 0)

By specifying the absolute value command or the incremental value command in the sub function of the point table, the automatic continuous operation can be performed. The following shows how to set.

| Point table setting |  |   |  |  |  |
|---------------------|--|---|--|--|--|
| Dwall               | Sub function                             |   |  |  |  |
| Dwell               | When the position data is absolute value | When the position data is incremental value |  |  |  |
| 1 or more           | 1  | 3   |  |  |  |

#### a) Positioning in a single direction

The following shows an operation example with the set values listed in the table below. In this example, point table No. 1 and No. 3 are set to the absolute value command method, and point table No. 2 the incremental value command method.

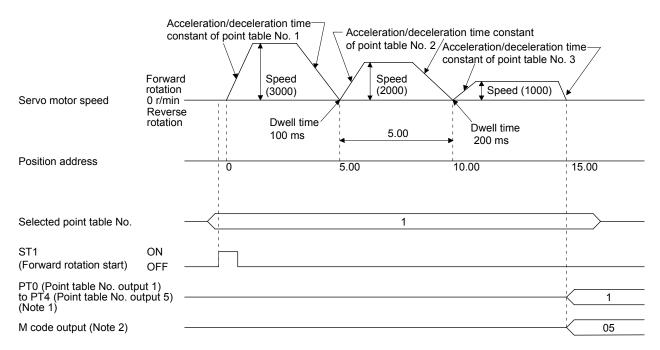

|   | Point table<br>No. | Position data<br>[10 <sup>S™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note 2) |
|---|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|--------------------|
| ſ | 1                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 100        | 1            | 05                 |
| Г | 2                  | 5.00                                   | 2000                         | 150                                   | 200                                   | 200        | 3            | 10                 |
|   | 3                  | 15.00                                  | 1000                         | 300                                   | 100                                   | Disabled   | 0 (Note 1)   | 15                 |

Note 1. Always set "0" or "2" to the sub function of the last point table of the consecutive point tables.

0: When using the point table with the absolute value command method

2: When using the point table with the incremental value command method

2. M code will be available in the future.

Note 1. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.

#### b) Positioning in the reverse direction midway

The following shows an operation example with the set values listed in the table below. In this example, point table No. 1 and No. 3 are set to the absolute value command method, and point table No. 2 the incremental value command method.

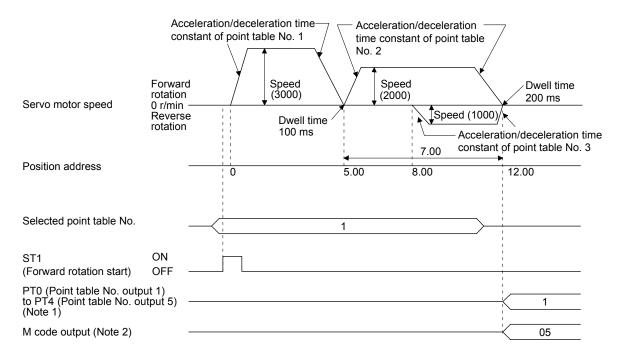

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note 2) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|--------------------|
| 1                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 100        | 1            | 05                 |
| 2                  | 7.00                                   | 2000                         | 150                                   | 200                                   | 200        | 3            | 10                 |
| 3                  | 8.00                                   | 1000                         | 300                                   | 100                                   | Disabled   | 0 (Note 1)   | 15                 |

Note. 1. Always set "0" or "2" to the sub function of the last point table of the consecutive point tables.

0: When using the point table with the absolute value command method

2: When using the point table with the incremental value command method

2. M code will be available in the future.

Note 1. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.

#### c) Position data in degrees

The following shows an operation example with the set values listed in the table below. In this example, point table No. 1, No. 2, and No. 4 are set to the absolute value command method, and point table No. 3 the incremental value command method.

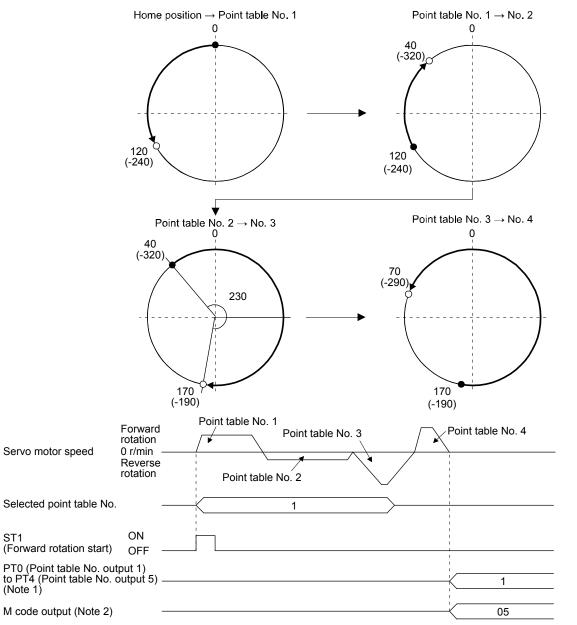

| Point table<br>No. | Position data<br>[degree] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note 2) |
|--------------------|---------------------------|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|--------------------|
| 1                  | 120.000                   | 1000                         | 100                                   | 150                                   | 100        | 1            | 05                 |
| 2                  | -320.000                  | 500                          | 150                                   | 100                                   | 200        | 1            | 10                 |
| 3                  | -230.000                  | 3000                         | 200                                   | 300                                   | 150        | 3            | 15                 |
| 4                  | 70.000                    | 1500                         | 300                                   | 100                                   | Disabled   | 0 (Note 1)   | 20                 |

Note 1. Always set "0" or "2" to the sub function of the last point table of the consecutive point tables.

0: When using the point table with the absolute value command method

2: When using the point table with the incremental value command method

2. M code will be available in the future.

Note 1. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.

 Absolute value command method ([Pr. PT01] = \_ \_ 1) The position data of the incremental value command method is the sum of the position data of consecutive point tables.

The following shows how to set.

| Point table setting |   |  |  |  |  |
|---------------------|---|--|--|--|--|
| Dwell Sub function  |   |  |  |  |  |
| 1 or more           | 1 |  |  |  |  |

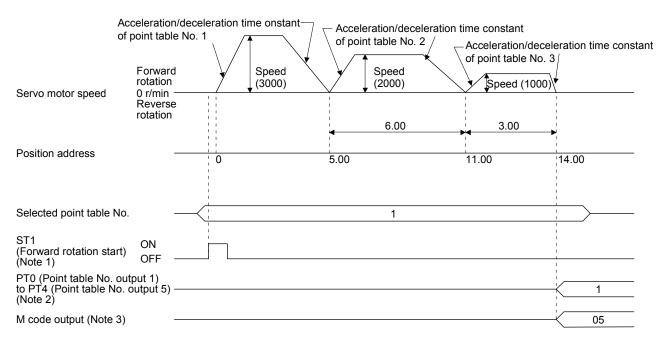

#### a) Positioning in a single direction

The following shows an operation example with the set values listed in the table below.

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note 2) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|--------------------|
| 1                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 100        | 1            | 05                 |
| 2                  | 6.00                                   | 2000                         | 150                                   | 200                                   | 200        | 1            | 10                 |
| 3                  | 3.00                                   | 1000                         | 300                                   | 100                                   | Disabled   | 0 (Note 1)   | 15                 |

Note 1. Always set "0" to the sub function of the last point table among the consecutive point tables.

2. M code will be available in the future.

Note 1. Switching on ST2 (Reverse rotation start) starts positioning in the reverse rotation direction.

- 2. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.
- 3. M code will be available in the future.

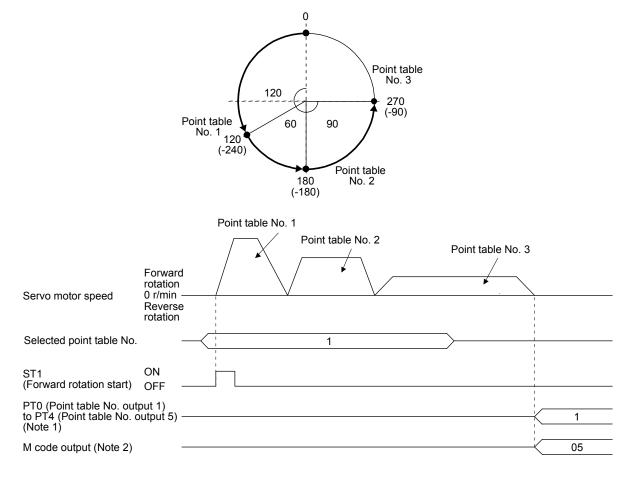

| Point table<br>No. | Position data<br>[degree] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note 2) |
|--------------------|---------------------------|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|--------------------|
| 1                  | 120.000                   | 3000                         | 100                                   | 150                                   | 0          | 1            | 05                 |
| 2                  | 60.000                    | 1500                         | 150                                   | 100                                   | 0          | 1            | 10                 |
| 3                  | 90.000                    | 1000                         | 300                                   | 100                                   | Disabled   | 0 (Note 1)   | 15                 |

# b) Position data in degrees

The following shows an operation example with the set values listed in the table below.

Note 1. Always set "0" or "2" to the sub function of the last point table of the consecutive point tables.0: When using the point table with the absolute value command method

2: When using the point table with the incremental value command method

- Note 1. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.
  - 2. M code will be available in the future.

# (c) Varying-speed operation

By setting the sub function of the point table, the servo motor speed during positioning can be changed. Point tables are used by the number of the set speed.

1) Absolute value command method ([Pr. PT01] = \_ \_ 0)

Set "1" or "3" to the sub function to execute the positioning at the speed set in the following point table.

At this time, the position data selected at start is enabled, and the acceleration/deceleration time constant set in the next and subsequent point tables is disabled.

By setting "1" or "3" to sub functions until point table No. 30, the operation can be performed at maximum 31 speeds.

Always set "0" or "2" to the sub function of the last point table.

To perform varying-speed operation, always set "0" to the dwell.

Setting "1" or more enables the automatic continuous positioning operation.

The following table shows an example of setting.

| Point table No. | Dwell [ms] (Note 1) | Sub function | Varying-speed operation      |  |  |
|-----------------|---------------------|--------------|------------------------------|--|--|
| 1               | 0                   | 1            |                              |  |  |
| 2               | 0                   | 3            | Consecutive point table data |  |  |
| 3               | Disabled            | 0 (Note 2)   |                              |  |  |
| 4               | 0                   | 3            |                              |  |  |
| 5               | 0                   | 1            | Consecutive point table data |  |  |
| 6               | Disabled            | 2 (Note 2)   |                              |  |  |

Note 1. Always set "0".

2 Always set "0" or "2" to the sub function of the last point table among the consecutive point tables.

#### a) Positioning in a single direction

The following shows an operation example with the set values listed in the table below. In this example, point table No. 1 and No. 3 are set to the absolute value command method, and point table No. 2 the incremental value command method.

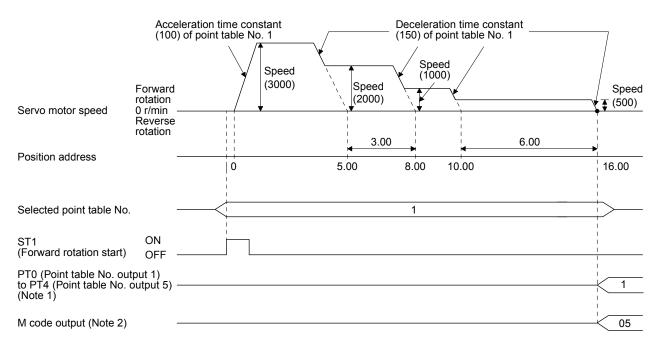

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms]<br>(Note 1) | Sub function | M code<br>(Note 3) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------------------|--------------|--------------------|
| 1                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 0                      | 1            | 05                 |
| 2                  | 3.00                                   | 2000                         | Disabled                              | Disabled                              | 0                      | 3            | 10                 |
| 3                  | 10.00                                  | 1000                         | Disabled                              | Disabled                              | 0                      | 1            | 15                 |
| 4                  | 6.00                                   | 500                          | Disabled                              | Disabled                              | Disabled               | 2 (Note 2)   | 20                 |

Note 1. Always set "0".

2. Always set "0" or "2" to the sub function of the last point table of the consecutive point tables.

0: When using the point table with the absolute value command method

2: When using the point table with the incremental value command method

- Note 1. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.
  - 2. M code will be available in the future.

#### b) Positioning in the reverse direction midway

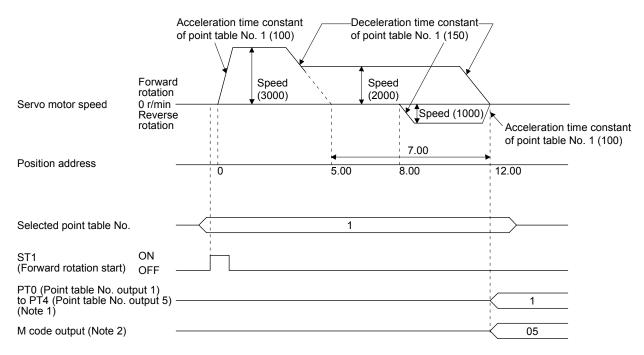

The following shows an operation example with the set values listed in the table below. In this example, point table No. 1 and No. 3 are set to the absolute value command method, and point table No. 2 the incremental value command method.

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms]<br>(Note 1) | Sub function | M code<br>(Note 3) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------------------|--------------|--------------------|
| 1                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 0                      | 1            | 05                 |
| 2                  | 7.00                                   | 2000                         | Disabled                              | Disabled                              | 0                      | 3            | 10                 |
| 3                  | 8.00                                   | 1000                         | Disabled                              | Disabled                              | Disabled               | 0 (Note 2)   | 15                 |

Note 1. Always set "0".

2. Always set "0" or "2" to the sub function of the last point table of the consecutive point tables.

- 0: When using the point table with the absolute value command method
- 2: When using the point table with the incremental value command method
- 3. M code will be available in the future.

Note 1. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.

2) Absolute value command method ([Pr. PT01] = \_ \_ 1)

Setting "1" to the sub function executes positioning at the speed set in the following point table. At this time, the position data selected at start is enabled, and the acceleration/deceleration time constant set in the next and subsequent point tables is disabled.

By setting "1" to sub functions until point table No. 30, the operation can be performed at maximum 31 speeds.

Always set "0" to the sub function of the last point table.

To perform varying-speed operation, always set "0" to the dwell.

Setting "1" or more enables the automatic continuous positioning operation.

The following table shows an example of setting.

| Point table No. | Dwell [ms] (Note 1) | Sub function | Varying-speed operation      |  |  |
|-----------------|---------------------|--------------|------------------------------|--|--|
| 1               | 0                   | 1            |                              |  |  |
| 2               | 0                   | 1            | Consecutive point table data |  |  |
| 3               | Disabled            | 0 (Note 2)   |                              |  |  |
| 4               | 0                   | 1            |                              |  |  |
| 5               | 0                   | 1            | Consecutive point table data |  |  |
| 6               | Disabled            | 0 (Note 2)   |                              |  |  |

Note 1. Always set "0".

Always set "0" to the sub function of the last point table among the consecutive point tables.

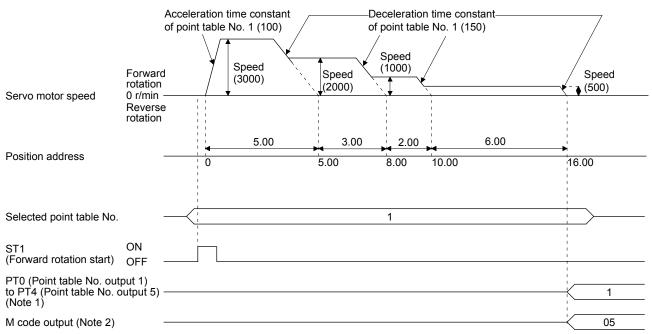

The following shows an operation example with the set values listed in the table below.

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms]<br>(Note 1) | Sub function | M code<br>(Note 3) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------------------|--------------|--------------------|
| 1                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 0                      | 1            | 05                 |
| 2                  | 3.00                                   | 2000                         | Disabled                              | Disabled                              | 0                      | 1            | 10                 |
| 3                  | 2.00                                   | 1000                         | Disabled                              | Disabled                              | 0                      | 1            | 15                 |
| 4                  | 6.00                                   | 500                          | Disabled                              | Disabled                              | Disabled               | 0 (Note 2)   | 20                 |

Note 1. Always set "0".

2. Always set "0" to the sub function of the last point table among the consecutive point tables.

3. M code will be available in the future.

Note 1. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.

(d) Automatic repeat positioning operation

By setting the sub function of the point table, the operation pattern of the set point table No. can be returned to, and the positioning operation can be performed repeatedly.

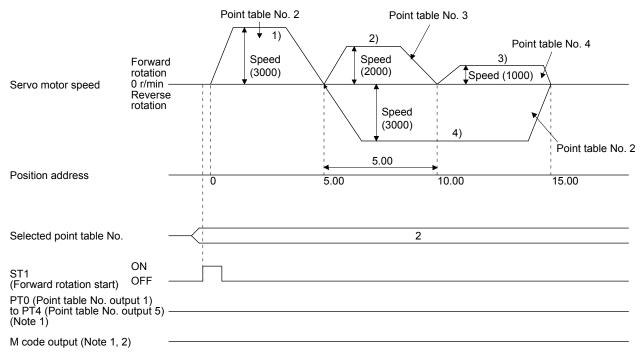

- Absolute value command method ([Pr. PT01] = \_\_\_0) Setting "8" or "10" to the sub function performs an automatic continuous operation or a varying-speed operation until that point table, and after the completion of positioning, performs the operation again from the operation pattern of the point table No. used at start-up. Setting "9" or "11" to the sub function performs an automatic continuous operation or a varying-speed operation until that point table, and after the completion of positioning, performs the operation until that point table, and after the completion of positioning, performs the operation again from the operation pattern of point table No. 1.
  - a) Automatic repeat positioning operation by absolute value command method Example 1. Operations when "8" is set to the sub function of point table No. 4

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|------------------|
| 1                  | 4.00                                   | 1500                         | 200                                   | 100                                   | 150        | 1            | 01               |
| 2                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 100        | 1            | 05               |
| 3                  | 5.00                                   | 2000                         | 150                                   | 200                                   | 200        | 3            | 10               |
| 4                  | 15.00                                  | 1000                         | 300                                   | 100                                   | 150        | 8            | 15               |

Note. M code will be available in the future.

**Operation sequence** 

- 1) Starting with point table No. 2
- 2) Executing point table No. 3
- 3) Executing point table No. 4
- 4) Executing again point table No.2 used at start-up when "8" is set to the sub function of point table No. 4
- 5) Repeating the above execution in the sequence of 2) to 3) to 4) to 2) to 3) to 4)

Note 1. PT0 to PT4 and M code are not outputted in automatic continuous operation. 2. M code will be available in the future.

| Point table<br>No. | Position data<br>[10 <sup>S™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|------------------|
| 1                  | 0.00                                   | 3000                         | 100                                   | 150                                   | 100        | 1            | 05               |
| 2                  | 5.00                                   | 2000                         | 150                                   | 200                                   | 200        | 1            | 10               |
| 3                  | 15.00                                  | 1000                         | 300                                   | 100                                   | 150        | 9            | 15               |

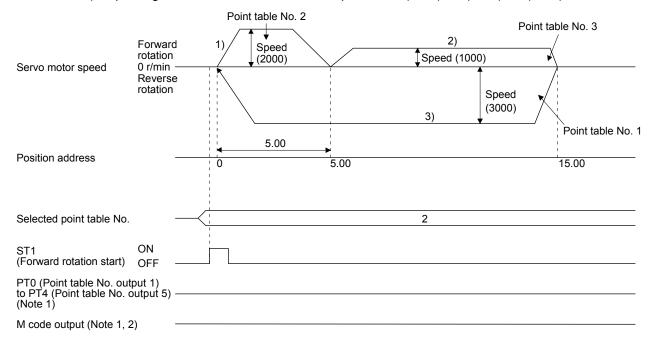

Example 2. Operations when "9" is set to the sub function of point table No. 3

**Operation sequence** 

1) Starting with point table No. 2

2) Executing point table No. 3

- 3) Executing point table No.1 when "9" is set to the sub function of point table No. 3
- 4) Repeating the above execution in the sequence of 1) to 2) to 3) to 1) to 2) to 3)

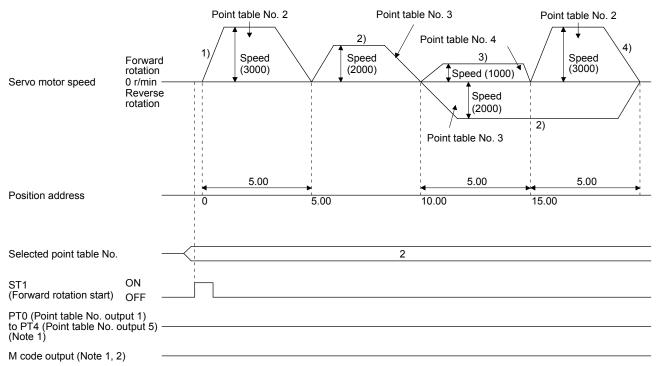

Note 1. PT0 to PT4 and M code are not outputted in automatic continuous operation.

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|------------------|
| 1                  | 4.00                                   | 1500                         | 200                                   | 100                                   | 150        | 1            | 01               |
| 2                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 100        | 3            | 05               |
| 3                  | 10.00                                  | 2000                         | 150                                   | 200                                   | 200        | 1            | 10               |
| 4                  | 5.00                                   | 1000                         | 300                                   | 100                                   | 150        | 10           | 15               |

b) Automatic repeat positioning operation by incremental value command method Example 1. Operations when "10" is set to the sub function of point table No. 4

**Operation sequence** 

- 1) Starting with point table No. 2
- 2) Executing point table No. 3
- 3) Executing point table No. 4
- Executing again point table No.2 used at start-up when "10" is set to the sub function of point table No. 4
- 5) Repeating the above execution in the sequence of 1) to 2) to 3) to 4) to 2) to 3) to 4)

Note 1. PT0 to PT4 and M code are not outputted in automatic continuous operation.

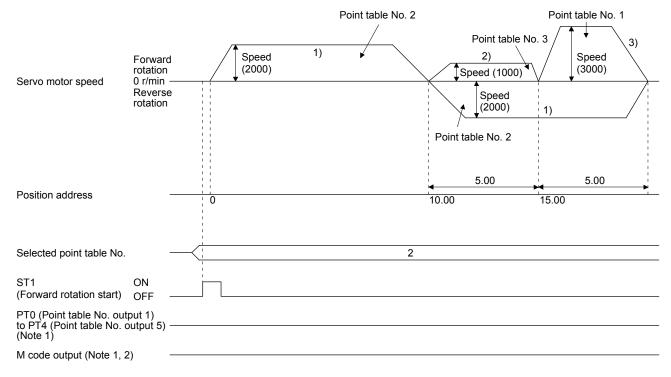

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|------------------|
| 1                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 100        | 3            | 05               |
| 2                  | 10.00                                  | 2000                         | 150                                   | 200                                   | 200        | 1            | 10               |
| 3                  | 5.00                                   | 1000                         | 300                                   | 100                                   | 150        | 11           | 15               |

Example 2. Operations when "11" is set to the sub function of point table No. 3

Operation sequence

1) Starting with point table No. 2

- 2) Executing point table No. 3
- 3) Executing point table No.1 when "11" is set to the sub function of point table No. 3
- 4) Repeating the above execution in the sequence of 1) to 2) to 3) to 1) to 2) to 3)

Note 1. PT0 to PT4 and M code are not outputted in automatic continuous operation.

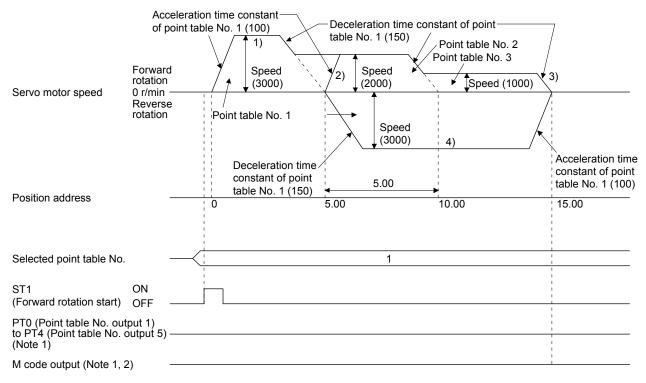

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|------------------|
| 1                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 0          | 1            | 05               |
| 2                  | 5.00                                   | 2000                         | Disabled                              | Disabled                              | 0          | 3            | 10               |
| 3                  | 15.00                                  | 1000                         | Disabled                              | Disabled                              | 0          | 8            | 15               |

# c) Varying-speed operation by absolute value command method Example. Operations when "8" is set to the sub function of point table No. 3

Note. M code will be available in the future.

Operation sequence

- 1) Starting with point table No. 1
- 2) Varying the speed and executing point table No. 2
- 3) Varying the speed and executing point table No. 3
- 4) Executing point table No.1 used at start-up in CW direction when "8" is set to the sub function of point table No. 3
- 5) Repeating the above execution in the sequence of 1) to 2) to 3) to 4) to 2) to 3) to 4)

Note 1. PT0 to PT4 and M code are not outputted in automatic continuous operation.

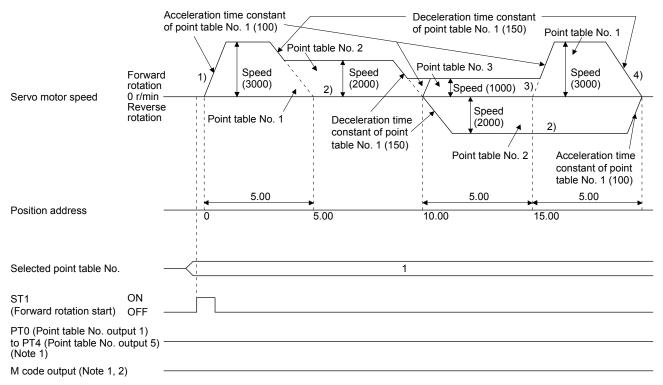

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|------------------|
| 1                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 0          | 3            | 05               |
| 2                  | 10.00                                  | 2000                         | 150                                   | 200                                   | 0          | 1            | 10               |
| 3                  | 5.00                                   | 1000                         | 300                                   | 100                                   | 0          | 10           | 15               |

# d) Varying-speed operation by incremental value command method Example. Operations when "10" is set to the sub function of point table No. 3

Note. M code will be available in the future.

**Operation sequence** 

- 1) Starting with point table No. 1
- 2) Varying the speed and executing point table No. 2
- 3) Varying the speed and executing point table No. 3
- 4) Varying the speed, and executing point table No.1 when "10" is set to the sub function of point table No. 3
- 5) Repeating the above execution in the sequence of 1) to 2) to 3) to 4) to 2) to 3) to 4)

Note 1. PT0 to PT4 and M code are not outputted in automatic continuous operation.

2) Absolute value command method ([Pr. PT01] = \_\_\_1) Setting "8" to the sub function performs automatic continuous operation or varying-speed operation until that point table, and after the completion of positioning, performs the operation again from the operation pattern of the set point table.

Setting "9" to the sub function performs automatic continuous operation or varying-speed operation until that point table, and after the completion of positioning, performs the operation again from the operation pattern of point table No. 1.

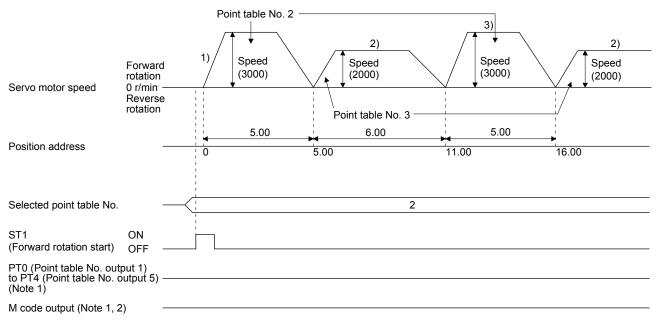

b) Automatic repeat positioning operation by incremental value command method Example 1. Operations when "8" is set to the sub function of point table No. 3

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|------------------|
| 1                  | 4.00                                   | 1500                         | 200                                   | 100                                   | 150        | 1            | 01               |
| 2                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 100        | 1            | 05               |
| 3                  | 6.00                                   | 2000                         | 150                                   | 200                                   | 200        | 8            | 10               |

Note. M code will be available in the future.

**Operation sequence** 

- 1) Starting with point table No. 2
- 2) Executing point table No. 3
- 3) Executing again point table No.2 used at start-up when "8" is set to the sub function of point table No. 3
- 4) Repeating the above execution in the sequence of 1) to 2) to 3) to 2) to 3)

Note 1. PT0 to PT4 and M code are not outputted in automatic continuous operation.

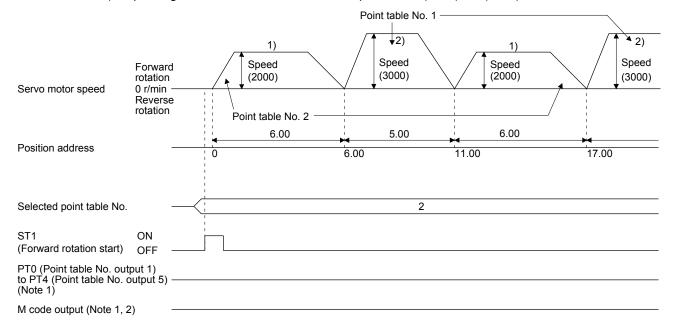

| Point table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note) |
|--------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|------------------|
| 1                  | 5.00                                   | 3000                         | 100                                   | 150                                   | 100        | 1            | 05               |
| 2                  | 6.00                                   | 2000                         | 150                                   | 200                                   | 200        | 9            | 10               |

Operation sequence

1) Starting with point table No. 2

2) Executing point table No.1 when "9" is set to the sub function of point table No. 2

3) Repeating the above execution in the sequence of 1) to 2) to 1) to 2)

Note 1. PT0 to PT4 and M code are not outputted in automatic continuous operation.

| Poi | int table<br>No. | Position data<br>[10 <sup>s™</sup> µm] | Servo motor<br>speed [r/min] | Acceleration<br>time constant<br>[ms] | Deceleration<br>time constant<br>[ms] | Dwell [ms] | Sub function | M code<br>(Note) |
|-----|------------------|--|------------------------------|---------------------------------------|---------------------------------------|------------|--------------|------------------|
|     | 1                | 5.00                                   | 3000                         | 100                                   | 150                                   | 0          | 1            | 05               |
|     | 2                | 6.00                                   | 2000                         | Disabled                              | Disabled                              | 0          | 8            | 10               |

### b) Varying-speed operation by incremental value command method Example. Operations when "8" is set to the sub function of point table No. 2

Note. M code will be available in the future.

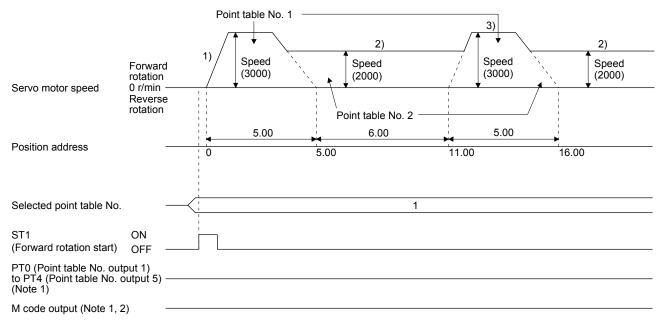

Operation sequence

1) Starting with point table No. 1

2) Varying the speed and executing point table No. 2

3) Executing again point table No.1 used at start-up when "8" is set to the sub function of point table No. 2

4) Repeating the above execution in the sequence of 1) to 2) to 3) to 2) to 3)

Note 1. PT0 to PT4 and M code are not outputted in automatic continuous operation.

2. M code will be available in the future.

### (e) Temporary stop/restart

When TSTP (Temporary stop/restart) is switched on during automatic operation, the servo motor decelerates with the deceleration time constant of the point table being executed, and then stops temporarily.

Switching on TSTP (Temporary stop/restart) again restarts the servo motor rotation for the remaining distance.

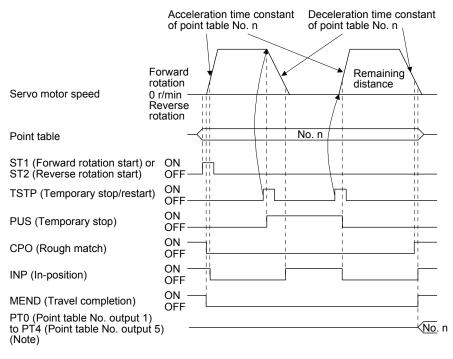

During a temporary stop, ST1 (Forward rotation start) or ST2 (Reverse rotation start) does not function even if it is switched on.

When automatic operation mode is changed to manual operation mode during a temporary stop, the remaining travel distance is cleared at the time of servo-off or inputting the clear signal.

The temporary stop/restart input does not function during a home position return or JOG operation.

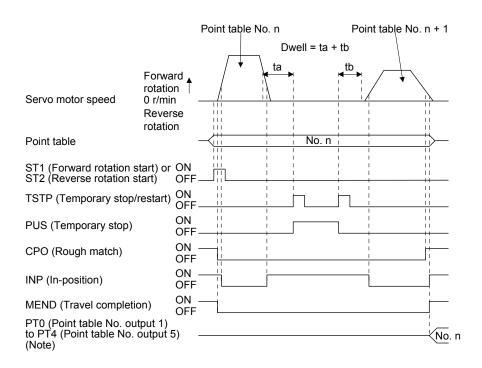

| Operation status        | Automatic operation | Manual operation | Home position<br>return |
|-------------------------|---------------------|------------------|-------------------------|
| During a stop           |                     |                  |                         |
| During acceleration     | Pause               |                  |                         |
| At a constant speed     | Pause               |                  |                         |
| Deceleration            |                     |                  |                         |
| During a temporary stop | Restart             |                  |                         |

1) When the servo motor is rotating

Note. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.

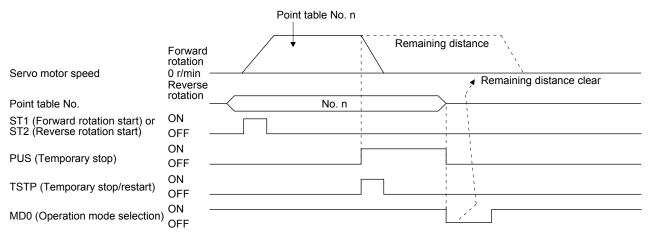

### 2) During dwell

Note. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.

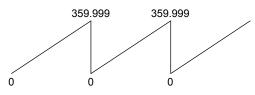

(f) Suspension of automatic operation

Suspend the automatic operation or change the operation pattern in the following procedure. To stop the operation in the middle of positioning, stop the servo motor with TSTP (Temporary stop/restart), switch off MD0 (Operation mode selection 1), and then set to the manual mode. At this time, the remaining travel distance is cleared.

- (g) Using a control unit of "degree"
  - 1) Current position/command position address

The current position/command position address is of ring-address type.

2) Software limit activation/deactivation setting

●After changing the "+" or "-" sign of an axis with the software limit activation setting, perform a home position return.

When activating the software limit in an incremental system, perform a home position return after power-on.

a) Setting range

When the unit is set to "degree", the setting range of the software limit is from 0 degree (lower limit) to 359.999 degrees (upper limit).

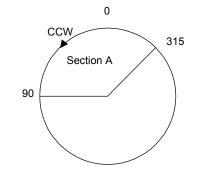

When you set a value other than 0 degree to 359.999 degrees in [Pr. PT15] to [Pr. PT18], the set value is converted as follows. (It will be clamped between 0 degree and 359.999 degrees.)

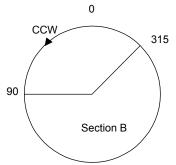

| Software limit value                 | After conversion   |
|--------------------------------------|--|
| 360.000 degrees to 999.999 degrees   | The remainder of the set value divided by 360                      |
| -0.001 degrees to -359.999 degrees   | The sum of the set value and 360                                   |
| -360.000 degrees to -999.999 degrees | The sum of 360 and the quotient of the set<br>value divided by 360 |

b) When the software limit is enabled

Set the software limit - ([Pr. PT17] and [Pr. PT18]) for the start position and the software limit + ([Pr. PT15] and [Pr. PT16]) for the end position.

The movable range is the section from - to + in the CCW direction.

Set the movable range of section A as follows:

- Software limit ... 315.000 degrees
- Software limit + ... 90.000 degrees

Set the movable range of section B as follows:

- Software limit ... 90.000 degrees
- Software limit + ... 315.000 degrees

c) When the software limit is disabled

When deactivating the software limit, set the same values to the software limit - ([Pr. PT17] and [Pr. PT18]) and the software limit + ([Pr. PT15] and [Pr. PT16]). Control can be performed independently of the software limit setting.

- 3) Position range output enabling/disabling setting
  - a) Setting range

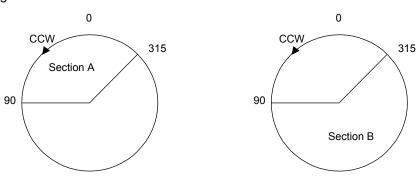

When the unit is set to "degree", the setting range of the position range output is from 0 degree (lower limit) to 359.999 degrees (upper limit).

When you set a value other than 0 degree to 359.999 degrees in [Pr. PT19] to [Pr. PT22], the set value is converted as follows. (It will be clamped between 0 degree and 359.999 degrees.)

| Position range output address        | After conversion  |
|--------------------------------------|---|
| 360.000 degrees to 999.999 degrees   | The remainder of the set value divided by 360                   |
| -0.001 degrees to -359.999 degrees   | The sum of the set value and 360                                |
| -360.000 degrees to -999.999 degrees | The sum of 360 and the quotient of the set value divided by 360 |

### b) Effective setting of position range output

Set the position range output address - ([Pr. PT21] and [Pr. PT22]) for the start position and the position range output address + ([Pr. PT19] and [Pr. PT20]) for the target position. The movable range is the section from - to + in the CCW direction.

Set the movable range of section A as follows:

- Position range output address ... 315.000 degrees
- Position range output address + ... 90.000 degrees

Set the movable range of section B as follows:

- Position range output address ... 90.000 degrees
- Position range output address + ... 315.000 degrees

### 4.3 Manual operation mode

For the machine adjustment, home position adjustment, and others, positioning to any point is possible using the JOG operation or the manual pulse generator.

### 4.3.1 JOG operation

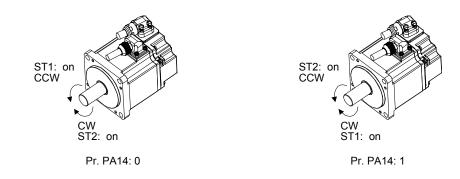

(1) Setting

According to the purpose of use, set input devices and parameters as shown below. In this case, DI0 (Point table No. selection 1) to DI4 (Point table No. selection 5) are disabled.

| Item  | Device/parameter to be used      | Setting   |
|---|----------------------------------|---|
| Manual operation mode selection                             | MD0 (Operation mode selection 1) | Switch off MD0.   |
| Servo motor rotation direction                              | [Pr. PA14]                       | Refer to (2) of this section.   |
| JOG speed   | [Pr. PT13]                       | Set the servo motor speed.  |
| Acceleration time<br>constant/Deceleration time<br>constant | Point table No. 1                | The acceleration/deceleration time constant of point table No. 1 is used. |

### (2) Servo motor rotation direction

| [Pr. PA14] setting | Servo motor rotation direction  |                                 |  |  |
|--------------------|---------------------------------|---------------------------------|--|--|
| [FI. FA14] Setting | ST1 (Forward rotation start) on | ST2 (Reverse rotation start) on |  |  |
| 0                  | CCW rotation                    | CW rotation                     |  |  |
| 1                  | CW rotation                     | CCW rotation                    |  |  |

### (3) Operation

Switching on ST1 (Forward rotation start) performs the operation at the JOG speed set by a parameter and the acceleration/deceleration constant of point table No. 1. For the rotation direction, refer to (2) of this section. Switching on ST2 (Reverse rotation start) starts the rotation in the reverse direction of ST1 (Forward rotation start).

Simultaneously switching on or off ST1 (Forward rotation start) and ST2 (Reverse rotation start) stops the operation.

## (4) Timing chart

| SON (Servo-on)               | ON                 |                  |              |      |                                       |          |
|------------------------------|--------------------|------------------|--------------|------|---------------------------------------|----------|
| 3014 (36140-011)             | OFF ·              |                  |              |      |                                       |          |
| RD (Ready)                   | ON                 | <b>4</b> → 80 ms |              |      |                                       |          |
| (iteday)                     | OFF ·              |                  |              |      |                                       |          |
| ALM (Malfunction)            | ON ·               |                  |              |      |                                       |          |
|                              | OFF                |                  |              |      |                                       |          |
| MD0                          | ON                 |                  |              |      |                                       |          |

### 4.3.2 Manual pulse generator operation

### (1) Setting

POINT

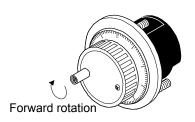

●To enhance noise tolerance, set "\_2\_\_" to [Pr. PA13] when the command pulse frequency is 500 kpulses/s or less, or set "\_3\_\_" to [Pr. PA13] when the command pulse frequency is 200 kpulses/s or less.

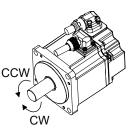

According to the purpose of use, set input devices and parameters as shown below. In this case, DI0 (Point table No. selection 1) to DI4 (Point table No. selection 5) are disabled.

| Item                                  | Device/parameter to be used      | Setting  |
|---------------------------------------|----------------------------------|--|
| Manual operation mode selection       | MD0 (Operation mode selection 1) | Switch off MD0.  |
| Manual pulse generator multiplication | [Pr. PT03]                       | Set the multiplication factor for the pulses<br>generated from the manual pulse generator.<br>For details, refer to (3) of this section. |
| Servo motor rotation direction        | [Pr. PA14]                       | Refer to (2) of this section.  |
| Command input pulse train input form  | [Pr. PA13]                       | Set "2" (A/B-phase pulse train).   |
| Pulse train filter selection          | [Pr. PA13]                       | Set other than "0" and "1".  |

#### (2) Servo motor rotation direction

|                    | Servo motor ro  | tation direction                                      |
|--------------------|---|---|
| [Pr. PA14] setting | Manual pulse generator operation:<br>forward rotation | Manual pulse generator operation:<br>reverse rotation |
| 0                  | CCW rotation  | CW rotation   |
| 1                  | CW rotation   | CCW rotation  |

### (3) Manual pulse generator multiplication

(a) Using the input signals (devices) for setting

In "Device setting" of MR Configurator2, set TP0 (Pulse generator multiplication 1) and TP1 (Pulse generator multiplication 2) to input signals.

| TP1 (Pulse generator        | TP0 (Pulse generator        | Servo motor rotation multiplication                  | Travel distance |        |          |         |
|-----------------------------|-----------------------------|--|-----------------|--------|----------|---------|
| multiplication 2)<br>(Note) | multiplication 1)<br>(Note) | factor for manual pulse generator<br>rotation amount | [mm]            | [inch] | [degree] | [pulse] |
| 0                           | 0                           | [Pr. PT03] setting enabled                           |                 |        |          |         |
| 0                           | 1                           | 1 time   | 0.001           | 0.0001 | 0.001    | 1       |
| 1                           | 0                           | 10 times   | 0.01            | 0.001  | 0.01     | 10      |
| 1                           | 1                           | 100 times  | 0.1             | 0.01   | 0.1      | 100     |

Note. 0: Off

1: On

### (b) Using the parameter for setting Using [Pr. PT03], set the servo motor rotation multiplication to the rotation amount of the manual pulse generator.

| [Pr. PT03] setting | Servo motor rotation multiplication to manual pulse | Travel distance |        |          |         |  |
|--------------------|---|-----------------|--------|----------|---------|--|
| [FI. FI03] Setting | generator rotation amount                           | [mm]            | [inch] | [degree] | [pulse] |  |
| 0_                 | 1 time  | 0.001           | 0.0001 | 0.001    | 1       |  |
| 1_                 | 10 times  | 0.01            | 0.001  | 0.01     | 10      |  |
| 2_                 | 100 times   | 0.1             | 0.01   | 0.1      | 100     |  |

### (4) Operation

Turning the manual pulse generator rotates the servo motor. For the rotation direction of the servo motor, refer to (2) of this section. When you turn the manual pulse generator during a JOG operation, the commands inputted from the manual pulse generator are adjusted by the commands of JOG operation.

### 4.4 Home position return mode

| POINT            |  |
|------------------|--|
| Before performed | rming the home position return, make sure that the limit switch  |
| operates.        |  |
| Check the h      | ome position return direction. An incorrect setting will cause a |
| reverse runr     | nina.  |

Check the input polarity of the proximity dog. Otherwise, it may cause an unexpected operation.

### 4.4.1 Outline of home position return

A home position return is performed to match the command coordinates with the machine coordinates. The home position return is required every time the input power is on.

This section shows the home position return methods of the servo amplifier. Select the optimum method according to the configuration and uses of the machine.

This servo amplifier has the home position return automatic retract function. When the machine stops beyond or on a proximity dog, this function automatically moves the machine back to the proper position to perform the home position return. Manual operation with JOG operation, etc. is unnecessary.

### (1) Home position return types

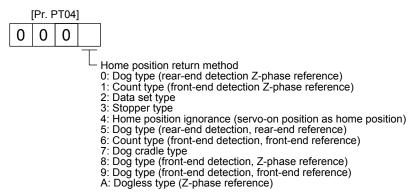

Select the optimum home position return type according to the machine type or others.

| Туре   | Home position return method   | Feature  |
|--|---|--|
| Dog type   | Deceleration starts from the front end of the proximity<br>dog. A position of the first Z-phase signal after the rear<br>end is passed or a position moved by the home<br>position shift amount from the Z-phase signal is set as<br>the home position.   | <ul> <li>Typical home position return method using<br/>a proximity dog</li> <li>The repeatability of the home position<br/>return is high.</li> <li>The machine is less loaded.</li> <li>Use this when the width of the proximity<br/>dog can be set equal to or greater than the<br/>deceleration distance of the servo motor.</li> </ul> |
| Count type   | Deceleration starts from the front end of the proximity<br>dog. After the proximity dog is passed, the motor<br>travels the specified travel distance. Then, the position<br>specified by the first Z-phase signal, or the position of<br>the first Z-phase signal shifted by the home position<br>shift distance is used as the home position. | <ul> <li>This is a home position return method using a proximity dog.</li> <li>Use this to minimize the length of the proximity dog.</li> </ul>  |
| Data set type  | An arbitrary position is set as the home position.  | <ul> <li>No proximity dog is required.</li> </ul>  |
| Stopper type   | A workpiece is pressed against a mechanical stopper,<br>and the position where it is stopped is set as the home<br>position.  | <ul> <li>Since the workpiece collides with the mechanical stopper, the home position return speed must be low enough.</li> <li>The strength of the machine and stopper must be increased.</li> </ul>   |
| Home position ignorance<br>(servo-on position as home<br>position) | Servo-on position is set as the home position.  |  |
| Dog type rear end reference  | Deceleration starts from the front end of the proximity<br>dog. After the rear end is passed, the position is shifted<br>by the travel distance after proximity dog and the home<br>position shift distance. The position after the shifts is<br>set as the home position.  | <ul> <li>The Z-phase signal is not required.</li> </ul>  |
| Count type front end reference                                     | Deceleration starts from the front end of the proximity<br>dog. A position moved by the moving amount after the<br>proximity dog and the home position shift amount is set<br>as the home position.   | The Z-phase signal is not required.  |
| Dog cradle type  | After the front end of the proximity dog is detected, the position specified by the first Z-phase signal is used as the home position.  |  |
| Dog type last Z-phase reference                                    | After the front end of the proximity dog is detected, the position is shifted away from the proximity dog in the reverse direction. Then, the position specified by the first Z-phase signal or the position of the first Z-phase signal shifted by the home position shift distance is used as the home position.                              |  |
| Dog type front end reference                                       | Starting from the front end of the proximity dog, the position is shifted by the travel distance after proximity dog and the home position shift distance. The position after the shifts is used as the home position.  | <ul> <li>The Z-phase signal is not required.</li> </ul>  |
| Dogless Z-phase reference  | The position specified by the first Z-phase signal, or<br>the position of the first Z-phase signal shifted by the<br>home position shift distance is used as the home<br>position.  |  |

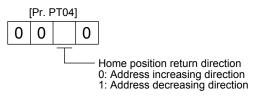

### (2) Parameters for home position return

To perform the home position return, set each parameter as follows.

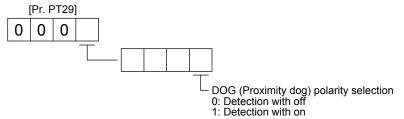

(a) Select the home position return type with [Pr. PT04 Home position return type].

(b) Select the starting direction for the home position return with [Pr. PT04 Home position return type]. Setting "0" starts the home position return in a direction of increasing the address from the current position. Setting "1" starts the home position return in a direction of decreasing the address from the current position.

(c) Select the polarity where the proximity dog is detected with the DOG (Proximity dog) polarity selection of [Pr. PT29 Function selection T-3].
 Setting "0" detects a proximity dog when DOG (Proximity dog) is switched off. Setting "1" detects a proximity dog when DOG (Proximity dog) is switched on.

### 4.4.2 Dog type home position return

This is a home position return method using a proximity dog. Deceleration starts at the front end of the proximity dog. After the rear end is passed, the position specified by the first Z-phase signal, or the position of the first Z-phase signal shifted by the specified home position shift distance is used as the home position.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item  | Device/parameter to be used  | Setting   |
|---|--|---|
| Home position return mode                                   | MD0 (Operation mode selection 1)                                       | Switch on MD0.  |
| selection   | DI0 (Point table No. selection 1) to DI4 (Point table No. selection 5) | Switch off DI0 to DI4.  |
| Dog type home position return                               | [Pr. PT04]0: Select the dog type.                                      |   |
| Home position return direction                              | [Pr. PT04]   | Refer to section 4.4.1 (2) to select the home position return direction.  |
| Dog input polarity  | [Pr. PT29]   | Refer to section 4.4.1 (2) to select the proximity dog input polarity.  |
| Home position return speed                                  | [Pr. PT05]   | Set the rotation speed specified until a dog is detected.   |
| Creep speed   | [Pr. PT06]   | Set the rotation speed specified after a dog is detected.   |
| Home position shift distance                                | [Pr. PT07]   | Set this item to shift the home position, which<br>is specified by the first Z-phase signal after<br>the rear end of a proximity dog is passed. |
| Acceleration time<br>constant/Deceleration time<br>constant | Point table No. 1  | The acceleration/deceleration time constant of point table No. 1 is used.   |
| Home position return position data                          | [Pr. PT08]   | Set the current position at the home position return completion.  |

### (2) Length of the proximity dog

To generate the Z-phase signal of the servo motor during the detection of DOG (Proximity dog), set the length of the proximity dog that satisfies equations (4.1) and (4.2).

$$L_1 \ge \frac{V}{60} \cdot \frac{td}{2} \quad \dots \qquad (4.1)$$

- $L_1$ : Length of the proximity dog
- V: Home position return speed [mm/min]
- td: Deceleration time [s]
- $L_2 \ge 2 \cdot \Delta S \cdots (4.2)$
- L<sub>2</sub>: Length of the proximity dog
- $\Delta S:$  Travel distance per servo motor revolution [mm]

| (3) Timing char |
|-----------------|
|-----------------|

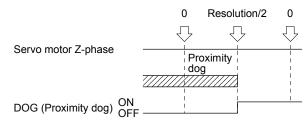

| MD0<br>(Operation mode<br>selection 1)<br>MEND<br>(Travel completion)<br>CPO (Rough match)<br>ZP<br>(Home position return<br>completion) | ON<br>OFF<br>OFF<br>ON<br>OFF<br>ON<br>OFF |   |               |
|--|--|---|---------------|
| Servo motor<br>speed 0 r/min<br>Reverse ro   | otation                                    | Acceleration time constant<br>Home position return speed<br>Creep speed<br>3 ms or shorter<br>Proximity dog<br>Home position<br>Home position<br>Shift distance<br>Home position<br>Shift distance<br>Home position | Home position |
| Z-phase  | ON<br>OFF                                  |   |               |
| DOG (Proximity dog)  | ON<br>OFF                                  |   |               |
| ST1<br>(Forward rotation start)  | ON<br>OFF                                  | ← 5 ms or longer  |               |
| ST2<br>(Reverse rotation start)  | ON<br>OFF                                  |   |               |

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

(4) Adjustment

For the dog type home position return, adjust the setting so that the Z-phase signal is always generated during the detection of a dog. Make an adjustment so that the rear end of DOG (Proximity dog) is positioned almost at the center between the positions specified by a Z-phase signal and the next Z-phase signal.

The generation position of the Z-phase signal can be checked with "Position within one-revolution" of "Status display" on MR Configurator2.

### 4.4.3 Count type home position return

For the count type home position return, after the front end of a proximity dog is detected, the position is shifted by the distance set in [Pr. PT09 Travel distance after proximity dog]. Then, the position specified by the first Z-phase signal is used as the home position. Therefore, when the on-time of DOG (Proximity dog) is 10 ms or more, the length of the proximity dog has no restrictions. When the required proximity dog length for using the dog type home position return cannot be reserved, or when DOG (Proximity dog) is entered electrically from the controller or the like, use the count type home position return.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item  | Device/parameter to be used   | Setting   |  |
|---|---|---|--|
| Home position return mode                                   | MD0 (Operation mode selection 1)  | Switch on MD0.  |  |
| selection   | DI0 (Point table No. selection 1) to<br>DI4 (Point table No. selection 5) | Switch off DI0 to DI4.  |  |
| Count type home position return                             | [Pr. PT04]  | 0: Select the count type.   |  |
| Home position return direction                              | [Pr. PT04]  | Refer to section 4.4.1 (2) to select the home position return direction.  |  |
| Dog input polarity  | [Pr. PT29]  | Refer to section 4.4.1 (2) to select the dog input polarity.  |  |
| Home position return speed                                  | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.   |  |
| Creep speed   | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.   |  |
| Home position shift distance                                | [Pr. PT07]  | After the front end of a proximity dog is<br>passed, the position is shifted by the travel<br>distance and then is specified by the first Z-<br>phase signal. Set this item to shift the position<br>of the first Z-phase signal. |  |
| Travel distance after proximity dog                         | [Pr. PT09]  | Set the travel distance specified after the front<br>end of the proximity dog is passed.  |  |
| Acceleration time<br>constant/Deceleration time<br>constant | Point table No. 1   | The acceleration/deceleration time constant of point table No. 1 is used.   |  |
| Home position return position data                          | [Pr. PT08]  | Set the current position at the home position return completion.  |  |

| (_)   |                        |   |  |
|---|------------------------|---|--|
| MD0<br>(Operation mode<br>selection 1)<br>MEND<br>(Travel completion) | ON<br>OFF<br>ON<br>OFF | ][  |  |
| CPO (Rough match)<br>ZP<br>(Home position return<br>completion)       | ON<br>OFF<br>ON<br>OFF |   | -  |

| Teverse   |                        |   | <br>eturn position data                          |
| Z-phase   | ON<br>OFF ——           |   |  |
| DOG (Proximity dog)   | ON<br>OFF              |   |  |
| ST1<br>(Forward rotation start)                                       | ON<br>OFF ——           | ←→ 5 ms or longer   |  |
| ST2<br>(Reverse rotation start)                                       | ON<br>OFF ——           |   |  |

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

#### (2) Timing chart

### 4.4.4 Data set type home position return

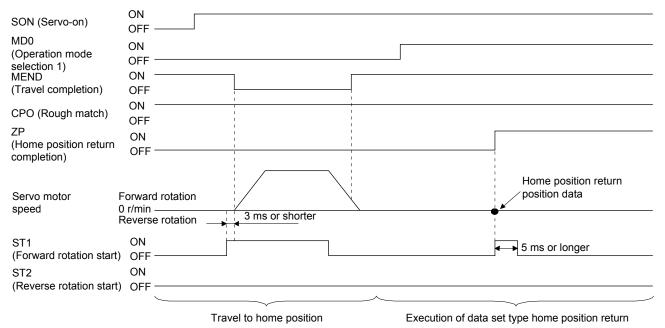

To set an arbitrary position as the home position, use the data set type home position return. The JOG operation, the manual pulse generator operation, and others can be used for the travel. The data set type home position return can be performed at servo-on only.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item                               | Device/parameter to be used   | Setting  |
|------------------------------------|---|--|
| Home position return mode          | MD0 (Operation mode selection 1)  | Switch on MD0.   |
| selection                          | DI0 (Point table No. selection 1) to<br>DI4 (Point table No. selection 5) | Switch off DI0 to DI4.   |
| Data set type home position return | [Pr. PT04]  | 2: Select the data set type.                                     |
| Home position return position data | [Pr. PT08]  | Set the current position at the home position return completion. |

#### (2) Timing chart

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

### 4.4.5 Stopper type home position return

For the stopper type home position return, the home position is set where the workpiece is pressed against the stopper of the machine by using the JOG operation, the manual pulse generator operation, or others.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item   | Device/parameter to be used   | Setting  |  |
|--|---|--|--|
| Home position return mode                            | MD0 (Operation mode selection 1)  | Switch on MD0.   |  |
| selection  | DI0 (Point table No. selection 1) to<br>DI4 (Point table No. selection 5) | Switch off DI0 to DI4.   |  |
| Stopper type home position return                    | [Pr. PT04]  | 3: Select the stopper type.  |  |
| Home position return direction                       | [Pr. PT04]  | Refer to section 4.4.1 (2) to select the home position return direction.   |  |
| Home position return speed                           | [Pr. PT05]  | Set the rotation speed until the workpiece is pressed against the mechanical stopper.  |  |
| Stopper time [Pr. PT10] data is of pressed (home per |   | Set the time from when the home position<br>data is obtained after the workpiece is<br>pressed against the stopper until when ZP<br>(home position return completion) is<br>outputted. |  |
| Stopper type home position return torque limit value | [Pr. PT11]  | Set the servo motor torque limit value when executing the stopper type home position return.   |  |
| Acceleration time constant of home position return   | Point table No. 1   | The acceleration/deceleration time constant of point table No. 1. is used.   |  |
| Home position return position data                   | [Pr. PT08]  | Set the current position when the home position return is complete.  |  |

| I                   |                       | TLA                | < | Pr. PT11                   | TLA      |

2. TLC turns on when a generated torque reaches a value set with any of [Pr. PA11 Forward rotation torque limit], [Pr. PA12 Reverse rotation torque limit], or [Pr. PC35 Internal torque limit 2].

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

4.4.6 Home position ignorance (servo-on position as home position)

POINT
 When you perform this home position return, it is unnecessary to switch to the home position return mode.

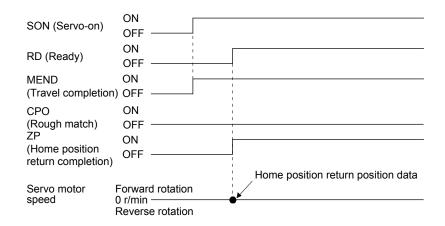

Servo-on position is set as the home position.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item                               | Parameter to be used | Setting   |
|------------------------------------|----------------------|---|
| Home position ignorance            | [Pr. PT04]           | 4: Select the home position ignorance.                              |
| Home position return position data | [Pr. PT08]           | Set the current position when the home position return is complete. |

#### (2) Timing chart

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

4.4.7 Dog type rear end reference home position return

• This home position return method depends on the timing of reading DOG (Proximity dog) that has detected the rear end of a proximity dog. Therefore, when a home position return is performed at a creep speed of 100 r/min, the home position has an error of 200 pulses (for HG series servo motor). The higher the creep speed, the greater the error of the home position.

Deceleration starts from the front end of a proximity dog. After the rear end is passed, the position is shifted by the travel distance after proximity dog and the home position shift distance. The position after the shifts is set as the home position. The home position return is available independently of the Z-phase signal. Changing the creep speed may change the home position.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item   | Device/parameter to be used   | Setting  |
|--|---|--|
| Home position return mode  | MD0 (Operation mode selection 1)  | Switch on MD0.   |
| Home position return mode selection  | DI0 (Point table No. selection 1) to<br>DI4 (Point table No. selection 5) | Switch off DI0 to DI4.   |
| Dog type rear end reference home position return                                       | [Pr. PT04]  | 5: Select the dog type (rear end detection/rear end reference).  |
| Home position return direction   | [Pr. PT04]  | Refer to section 4.4.1 (2) to select the home position return direction.                                 |
| Dog input polarity   | [Pr. PT29]  | Refer to section 4.4.1 (2) to select the dog input polarity.   |
| Home position return speed   | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.  |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.  |
| Home position shift distance   | [Pr. PT07]  | Set this to shift the home position, which is specified after the rear end of a proximity dog is passed. |
| Travel distance after proximity dog  | [Pr. PT09]  | Set the travel distance after the rear end of a proximity dog is passed.                                 |
| Acceleration time<br>constant/deceleration time<br>constant of home position<br>return | Point table No. 1   | The acceleration/deceleration time constant of point table No. 1 is used.                                |
| Home position return position data   | [Pr. PT08]  | Set the current position when the home position return is complete.                                      |

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

### (2) Timing chart

4.4.8 Count type front end reference home position return

POINT

- This home position return method depends on the timing of reading DOG (Proximity dog) that has detected the front end of a proximity dog. Therefore, when a home position return is performed with the creep speed of 100 r/min, the home position has an error of 200 pulses (for HG series servo motor). The higher the creep speed, the greater the error of the home position.
- After the front end of a proximity dog is detected, if a home position return ends without reaching the creep speed, [AL. 90.2] occurs. Set the travel distance after proximity dog and the home position shift distance enough for deceleration from the home position return speed to the creep speed.

Deceleration starts from the front end of a proximity dog. The position is shifted by the travel distance after proximity dog and the home position shift distance. The position after the shifts is set as the home position. The home position return is available independently of the Z-phase signal. Changing the creep speed may change the home position.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item   | Device/parameter to be used   | Setting   |
|--|---|---|
| Home position return mode  | MD0 (Operation mode selection 1)  | Switch on MD0.  |
| selection  | DI0 (Point table No. selection 1) to<br>DI4 (Point table No. selection 5) | Switch off DI0 to DI4.  |
| Count type front end<br>reference home position<br>return                              | [Pr. PT04]  | 6: Select the count type (front end detection/front end reference).                                       |
| Home position return direction   | [Pr. PT04]  | Refer to section 4.4.1 (2) to select the home position return direction.                                  |
| Dog input polarity   | [Pr. PT29]  | Refer to section 4.4.1 (2) to select the dog input polarity.  |
| Home position return speed   | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.   |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.   |
| Home position shift distance   | [Pr. PT07]  | Set this to shift the home position, which is specified after the front end of a proximity dog is passed. |
| Travel distance after proximity dog  | [Pr. PT09]  | Set the travel distance after the rear end of a proximity dog is passed.                                  |
| Acceleration time<br>constant/deceleration time<br>constant of home position<br>return | Point table No. 1   | The acceleration/deceleration time constant of point table No. 1 is used.                                 |
| Home position return position data   | [Pr. PT08]  | Set the current position when the home position return is complete.                                       |

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

### (2) Timing chart

### 4.4.9 Dog cradle type home position return

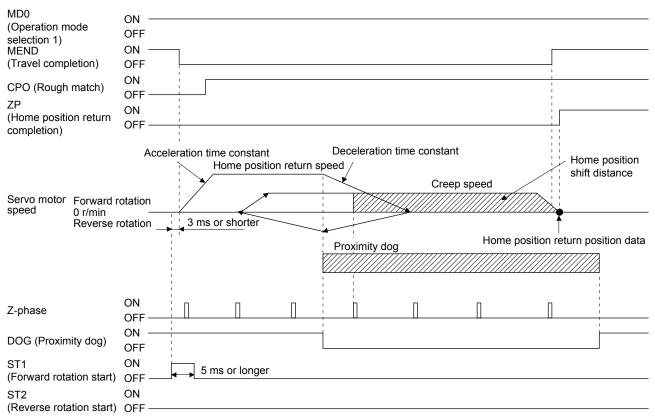

A position, which is specified by the first Z-phase signal after the front end of a proximity dog is detected, is set as the home position.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item   | Device/parameter to be used   | Setting  |
|--|---|--|
| Home position return mode  | MD0 (Operation mode selection 1)  | Switch on MD0.   |
| selection  | DI0 (Point table No. selection 1) to<br>DI4 (Point table No. selection 5) | Switch off DI0 to DI4.   |
| Dog cradle type home<br>position return  | [Pr. PT04]  | 7: Select the dog cradle type.   |
| Home position return direction   | [Pr. PT04]  | Refer to section 4.4.1 (2) to select the home position return direction.       |
| Dog input polarity   | [Pr. PT29]  | Refer to section 4.4.1 (2) to select the dog input polarity.                   |
| Home position return speed   | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.                      |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.                      |
| Home position shift distance   | [Pr. PT07]  | Set this to shift the home position, which is specified by the Z-phase signal. |
| Acceleration time<br>constant/deceleration time<br>constant of home position<br>return | Point table No. 1   | The acceleration/deceleration time constant of point table No. 1 is used.      |
| Home position return position data   | [Pr. PT08]  | Set the current position when the home position return is complete.            |

### (2) Timing chart

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

### 4.4.10 Dog type last Z-phase reference home position return

After the front end of a proximity dog is detected, the position is shifted away from the proximity dog at the creep speed in the reverse direction and then specified by the first Z-phase signal. The position of the first Z-phase signal is set as the home position.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item   | Device/parameter to be used  | Setting   |
|--|--|---|
| Home position return mode  | MD0 (Operation mode selection 1)                                       | Switch on MD0.  |
| selection  | DI0 (Point table No. selection 1) to DI4 (Point table No. selection 5) | Switch off DI0 to DI4.  |
| Dog type last Z-phase<br>reference home position<br>return                             | [Pr. PT04]   | 8: Select the dog type last Z-phase reference.                                      |
| Home position return direction   | [Pr. PT04]   | Refer to section 4.4.1 (2) to select the home position return direction.            |
| Dog input polarity   | [Pr. PT29]   | Refer to section 4.4.1 (2) to select the dog input polarity.                        |
| Home position return speed   | [Pr. PT05]   | Set the rotation speed specified until a dog is detected.                           |
| Creep speed  | [Pr. PT06]   | Set the rotation speed specified after a dog is detected.                           |
| Home position shift distance   | [Pr. PT07]   | Set this item to shift the home position, which is specified by the Z-phase signal. |
| Acceleration time<br>constant/deceleration time<br>constant of home position<br>return | Point table No. 1  | The acceleration/deceleration time constant of point table No. 1 is used.           |
| Home position return position data   | [Pr. PT08]   | Set the current position when the home position return is complete.                 |

| MD0<br>(Operation mode<br>selection 1)<br>MEND<br>(Travel completion) | ON<br>OFF<br>ON<br>OFF     |   |

(2) Timing chart

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

4.4.11 Dog type front end reference home position return type

• This home position return method depends on the timing of reading DOG (Proximity dog) that has detected the front end of a proximity dog. Therefore, when a home position return is performed at a creep speed of 100 r/min, the home position has an error of 200 pulses (for HG series servo motor). The higher the creep speed, the greater the error of the home position.

A position, which is shifted by the travel distance after proximity dog and the home position shift distance from the front end of a proximity dog, is set as the home position.

The home position return is available independently of the Z-phase signal. Changing the creep speed may change the home position.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item   | Device/parameter to be used   | Setting  |
|--|---|--|
| Home position return mode  | MD0 (Operation mode selection 1)  | Switch on MD0.   |
| selection  | DI0 (Point table No. selection 1) to<br>DI4 (Point table No. selection 5) | Switch off DI0 to DI4.   |
| Dog type front end reference home position return                                      | [Pr. PT04]  | 9: Select the dog type front end reference.                                    |
| Home position return direction   | [Pr. PT04]  | Refer to section 4.4.1 (2) to select the home position return direction.       |
| Dog input polarity   | [Pr. PT29]  | Refer to section 4.4.1 (2) to select the dog input polarity.                   |
| Home position return speed   | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.                      |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.                      |
| Home position shift distance   | [Pr. PT07]  | Set this to shift the home position, which is specified by the Z-phase signal. |
| Acceleration time<br>constant/deceleration time<br>constant of home position<br>return | Point table No. 1   | The acceleration/deceleration time constant of point table No. 1 is used.      |
| Home position return position data   | [Pr. PT08]  | Set the current position when the home position return is complete.            |

| MD0<br>(Operation mode<br>selection 1)<br>MEND<br>(Travel completion) | ON<br>OFF<br>ON<br>OFF                           |
|---|--|

| (Home position return completion)                                     | OFF  |
| Servo motor Forward ro<br>speed 0 r/min<br>Reverse ro                 | tation 3 ms or shorter Creep speed Proximity dog |
| DOG (Proximity dog)   | ONOFF  |
| ST1<br>(Forward rotation start)                                       | ON<br>OFF 5 ms or longer                         |
| ST2<br>(Reverse rotation start)                                       | ON<br>OFF  |

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

## (2) Timing chart

### 4.4.12 Dogless Z-phase reference home position return type

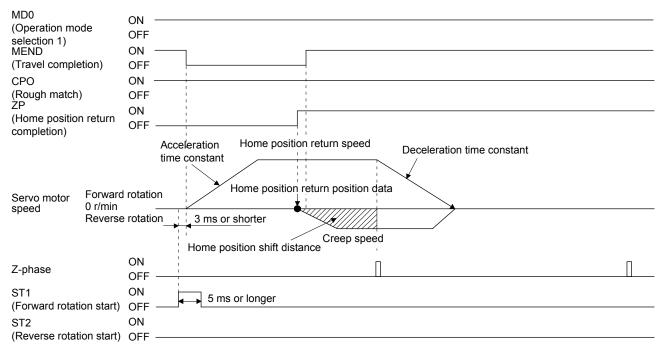

A position, which is shifted to by the home position shift distance from a position specified by the Z-phase pulse right after the start of the home position return, is set as the home position.

### (1) Device/parameter

Set input devices and parameters as follows.

| Item   | Device/parameter to be used   | Setting  |
|--|---|--|
| Home position return mode  | MD0 (Operation mode selection 1)  | Switch on MD0.   |
| selection  | DI0 (Point table No. selection 1) to<br>DI4 (Point table No. selection 5) | Switch off DI0 to DI4.   |
| Dogless Z-phase reference<br>home position return                                      | [Pr. PT04]  | A: Select the dogless type (Z-phase reference).                                |
| Home position return direction   | [Pr. PT04]  | Refer to section 4.4.1 (2) to select the home position return direction.       |
| Home position return speed   | [Pr. PT05]  | Set the rotation speed specified until the Z-<br>phase is detected.            |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after the Z-<br>phase is detected.            |
| Home position shift distance   | [Pr. PT07]  | Set this to shift the home position, which is specified by the Z-phase signal. |
| Acceleration time<br>constant/deceleration time<br>constant of home position<br>return | Point table No. 1   | The acceleration/deceleration time constant of point table No. 1 is used.      |
| Home position return position data   | [Pr. PT08]  | Set the current position when the home position return is complete.            |

### (2) Timing chart

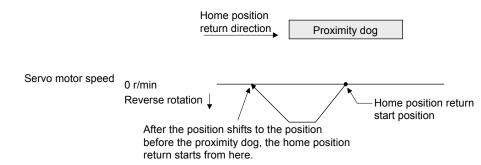

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

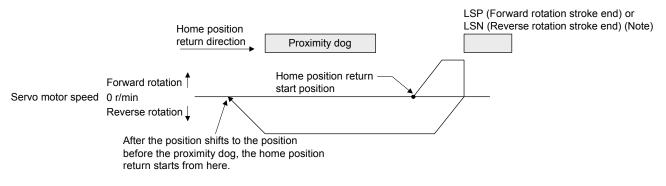

4.4.13 Automatic retract function used for the home position return

For a home position return using a proximity dog, if the home position return starts from or beyond the proximity dog, this function executes the home position return after the position is shifted back to where the home position return is possible.

(1) When the current position is on the proximity dog When the current position is on the proximity dog, the position is shifted back automatically to execute the home position return.

- (2) When the current position is beyond the proximity dog
  - The position is shifted in a direction of the home position return. When LSP (Forward rotation stroke end) or LSN (Reverse rotation stroke end) is detected, the position is shifted back automatically. The position will be shifted passing the proximity dog, and the travel will stop. The home position return will be restarted from that position. If the proximity dog is not detected, the travel stops at LSP or LSN on the opposite side, and [AL.90 Home position return incomplete warning] occurs.

Note. The software limit cannot be used instead of LSP (Forward stroke end) and LSN (Reverse stroke end).

4.4.14 Automatic positioning to home position function

POINT

The automatic positioning to the home position cannot be performed from outside the setting range of position data. In this case, perform the home position return again using the home position return.

If the home position is fixed by returning to the home position after the power-on, this function enables a high-speed automatic positioning to the home position. For the absolute position detection system, the home position return is unnecessary after the power-on.

If the automatic positioning to the home position is executed without completing the home position return, [AL. 90.1] will occur.

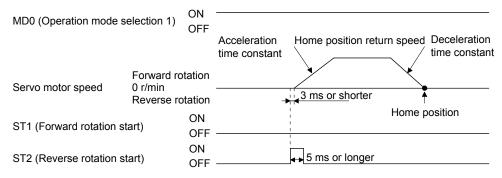

After the power-on, perform the home position return in advance.

Set input devices and parameters as follows.

| Item   | Device/parameter to be used   | Setting   |
|--|---|---|
| Home position return mode selection  | MD0 (Operation mode selection 1)  | Switch on MD0.  |
|  | DI0 (Point table No. selection 1) to<br>DI4 (Point table No. selection 5) | Switch off DI0 to DI4.  |
| Home position return speed   | [Pr. PT05]  | Set the servo motor speed to travel to the home position.                 |
| Acceleration time<br>constant/deceleration time<br>constant of home position<br>return | Point table No. 1   | The acceleration/deceleration time constant of point table No. 1 is used. |
| Home position return direction   | [Pr. PT04]  | Set the rotation direction in degrees.                                    |

Set the home position return speed of the automatic positioning to home position function with [Pr. PT05]. The data of point table No. 1 is used for acceleration/deceleration time constants. Switching on ST2 (Reverse rotation start) enables high-speed automatic return.

Set the rotation direction with home position return direction of [Pr. PT04] when the unit is set to degree.

### 4.5 Roll feed mode using the roll feed display function

The roll feed display function changes the display method of the current position and the command position in the status monitor.

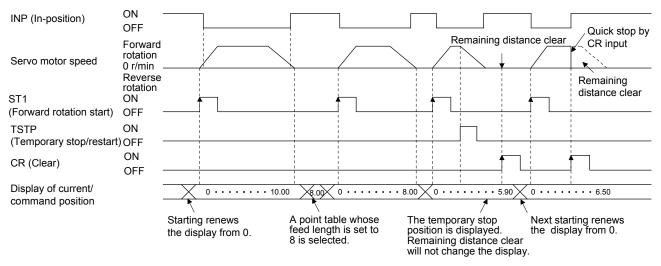

By using the roll feed display function, the servo amplifier can be used in the roll feed mode. The roll feed mode is compatible with the incremental system. Additionally, the feed speed can be changed by the override function during a operation. Refer to section 2.4 for details.

(1) Parameter setting

| No.  | Name   | Setting digit | Setting item   | Setting value | Setting   |
|------|--|---------------|--|---------------|---|
| PT26 | Current<br>position/command<br>position display<br>selection | ×_            | Current<br>position/command<br>position display<br>selection | 1_            | Select the roll feed display.   |
| PT26 | Electronic gear<br>fraction clear<br>selection               | x             | Electronic gear<br>fraction clear<br>selection               | 1             | Clear a fraction of the previous command by<br>the electronic gear at start of the automatic<br>operation. Always set "1" (enabled) in the<br>electronic gear fraction clear. |

### (2) Roll feed display function

When the roll feed display function is used, the status display of the current position and the command position at start will be 0.

### (3) Position data unit

The display unit is expressed in the unit set in [Pr. PT26], and the feed length multiplication is expressed in the unit set in [Pr. PT03].

When the unit is set in degrees, the roll feed display function is disabled. Refer to section 4.2.2 for details.

### (4) Operation method

Only the status display of the current position and command position changes. The operation method is the same as each operation mode.

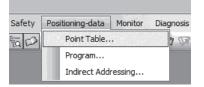

|                          | Operation mode                            | Detailed explanation |  |
|--------------------------|---|----------------------|--|
| Automatic operation      | Automatic operation using the point table | Section 4.2.2        |  |
| Manual operation         | JOG operation                             | Section 4.3.1        |  |
|                          | Manual pulse generator operation          | Section 4.3.2        |  |
| Home position return mod | Section 4.4                               |                      |  |

### 4.6 Point table setting method

The following shows the setting method of point tables using MR Configurator2.

### 4.6.1 Setting procedure

Click "Positioning-data" in the menu bar, and click "Point Table" in the menu.

The following window will be displayed.

|       |          | (i)                                 | (l) (m)                   | (c)                           | (d) (e)                       | (f)                   | (g)                         | (a) (b)         | (n)                        |                            |

|       | 31       | 0.000                               | 0                         | 0                             | 0                             | 0                     | 0                           | 0               | 0                          | 0                          |

### (1) Writing point table data (a)

Select changed point table data, and click "Selected Items Write" to write the changed point table data to the servo amplifier.

(2) Writing all point table data (b)Click "Write All" to write all the point table data to the servo amplifier.

# (3) Reading all point table data (c)Click the "Read" button to read all the point table data from the servo amplifier and display them.

- (4) Initial setting of point table data (d) Click the "Set to default" button to initialize all the data of point table No. 1 to 31. This function also initializes data currently being edited.
- (5) Verifying point table data (e)Click the "Verify" button to verify all the data displayed and data of the servo amplifier.
- (6) Detailed setting of point table data (f) Click the "Detailed Setting" to change position data range and unit in the point table window. Refer to section 4.6.2 for details.
- (7) Single-step feed (g) Click "Single-step Feed" to perform the single-step feed test operation. Refer to section 3.1.9 for details.
- (8) Copy and paste of point table data (h)Click "Copy" to copy the point table data. Click "Paste" to paste the copied point table data.
- (9) Inserting point table data (i) Click the "Insert" button to insert a block before the selected point table No. The selected block and later will be shifted down by one. The selected point table No. and lower rows will be shifted down one by one.
- (10) Deleting point table data (j) Click the "Delete" button to delete the selected block of the point table No. The selected block and later will be shifted up by one.
- (11) Changing point table data (k) After selecting the data to be changed, enter a new value, and click "Enter". You can change the displayed range and unit with "(6) Detailed setting of point table data" of this section.
- (12) Reading point table data (I)Click "Open" to read the point table data.
- (13) Saving point table data (m)Click "Save As" to save the point table data.
- (14) Updating project (n)Click "Update Project" to update the point table data to a project.

### 4.6.2 Detailed setting window

The position data range and unit can be changed with the detailed setting in the point table window. For the position data range and unit of [Pr. PT01] setting, refer to section 4.2.2. To reflect the setting for the corresponding parameter, click the "Update Project" button in the point table window.

| 1)  | Detailed Setting   |  |  |  |  |  |  |
|-----|--|--|--|--|--|--|--|
| 1)  | Command method selection (PT01 *CTY)   |  |  |  |  |  |  |
|     | Absolute value command system  |  |  |  |  |  |  |
|     | Move to the address (absolute value) where home position is used<br>as reference.          |  |  |  |  |  |  |
|     | Incremental value command system<br>Move from the current position data value that is set. |  |  |  |  |  |  |
| 0)  | Miscellaneous  |  |  |  |  |  |  |
| 2)  | Feed length multiplication parameter setting STM (PT03 *FTY)                               |  |  |  |  |  |  |
| 3)_ | 1  |  |  |  |  |  |  |
| 3)  | Position data unit setting (PT01 *CTY)   |  |  |  |  |  |  |
|     | mm   |  |  |  |  |  |  |
|     |  |  |  |  |  |  |  |
|     |  |  |  |  |  |  |  |
|     |  |  |  |  |  |  |  |
|     |  |  |  |  |  |  |  |
|     |  |  |  |  |  |  |  |
|     |  |  |  |  |  |  |  |
|     |  |  |  |  |  |  |  |
|     | OK Cancel  |  |  |  |  |  |  |
|     |  |  |  |  |  |  |  |

- Command method selection (PT01 \*CTY): 1)
   Select either the absolute position command method or the incremental value command method.
- (2) Others
  - (a) Feed length multiplication parameter setting STM (PT03 \*FTY): 2) Select a feed length multiplication from 1/10/100/1000.
  - (b) Position data unit setting (PT01 \*CTY): 3) Select a unit of position data from mm/inch/degree/pulse. When degree or pulse is selected for the unit, the setting of feed length multiplication will be disabled.

# 5. HOW TO USE THE PROGRAM

For the details of the following items, refer to chapter/section (of "MR-JE-\_A Servo Amplifier Instruction Manual") indicated in the table.

| Item                                  | Detailed explanation |  |  |
|---------------------------------------|----------------------|--|--|
| liem                                  | MR-JEA               |  |  |
| Switching power on for the first time | Section 4.1          |  |  |

POINT
For the mark detection function (Current position latch), refer to section 6.2.2.
For the mark detection function (Interrupt positioning), refer to section 6.2.3.

### 5.1 Startup

### 5.1.1 Power on and off procedures

When the servo amplifier is powered on for the first time, the control mode is set to position control mode. (Refer to section 4.2.1 of "MR-JE-\_A Servo Amplifier Instruction Manual".)

This section provides a case where the servo amplifier is powered on after setting the positioning mode.

### (1) Power-on

Switch the power on in the following procedure. Always follow this procedure at power-on.

- 1) Switch off SON (Servo-on).
- 2) Make sure that ST1 (Forward rotation start) is off.
- Switch on the main circuit power supply and the control circuit power supply. The display shows "Pos" and 2 s later shows data.

### (2) Power-off

- 1) Switch off ST1 (Forward rotation start).
- 2) Switch off SON (Servo-on).
- 3) Switch off the main circuit power supply and the control circuit power supply.

# 5.1.2 Stop

If any of the following situations occurs, the servo amplifier suspends and stops the operation of the servo motor.

Refer to section 3.10 of "MR-JE-\_A Servo Amplifier Instruction Manual" for the servo motor with an electromagnetic brake.

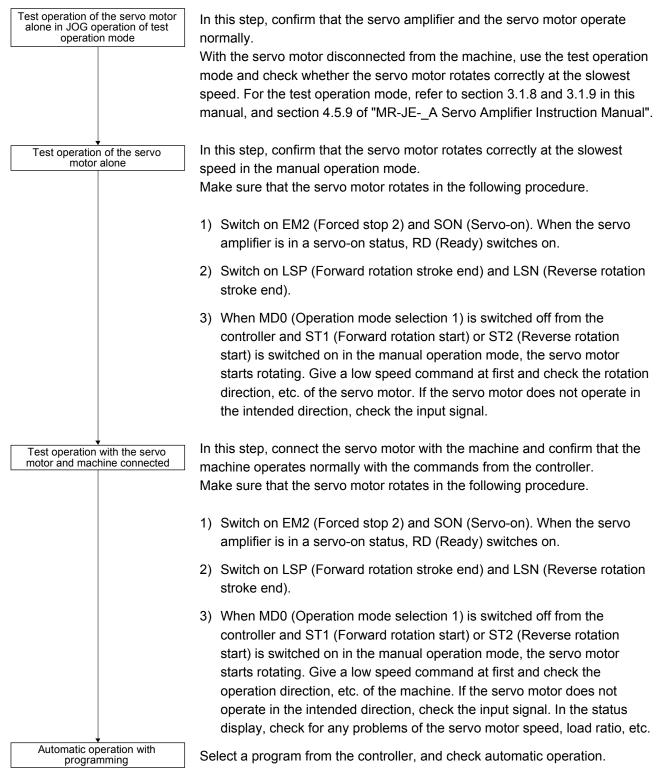

| Operation/command  | Stopping condition   |
|--|--|
| Switch off SON (Servo-on).   | The base circuit is shut off, and the servo motor coasts.  |
| Alarm occurrence   | The servo motor decelerates to a stop. With some alarms; however, the dynamic brake operates to stop the servo motor. (Refer to chapter 8. (Note)) |
| EM2 (Forced stop 2) off  | The servo motor decelerates to a stop. [AL. E6 Servo forced stop warning] occurs. Refer to section 2.3 for EM1.                                    |
| LSP (Forward rotation stroke end) off or LSN (Reverse rotation stroke end) off | The servo motor stops immediately and will be servo locked. Operation in the opposite direction is possible.                                       |

Note. Only a list of alarms and warnings is listed in chapter 8. Refer to "MELSERVO-JE Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

# 5.1.3 Test operation

Before starting an actual operation, perform a test operation to make sure that the machine operates normally.

Refer to section 5.1.1 for how to power on and off the servo amplifier.

# 5.1.4 Parameter setting

| POINT           |  |
|-----------------|--|
| ●The following  | g encoder cables are of four-wire type. When using any of these    |
| encoder cab     | les, set [Pr. PC22] to "1" to select the four-wire type. Incorrect |
| setting will re | esult in [AL. 16 Encoder initial communication error 1].           |
| MR-EKCBL30      | И-L  |
| MR-EKCBL30      | И-Н  |
| MR-EKCBL40      | И-Н  |
| MR-EKCBL50      | И-Н  |

When you use the servo in the program method, set [Pr. PA01] to "\_\_\_7" (Positioning mode (program method)). For the program method, the servo can be used by merely changing the basic setting parameters ([Pr. PA \_\_]) and positioning control parameters ([Pr. PT \_\_]) mainly.

As necessary, set other parameters.

The following table shows the necessary setting of [Pr. PA \_ ] and [Pr. PT \_ ] in the program method.

|                       | Operation mode selection item                                | Paramet    | er setting | Input devi      | ice setting            |

Note 1. MD0: Operation mode selection 1, DI0 to DI3: Program No. selection 1 to Program No. selection 4

2 Select a program containing a "ZRT" command, which performs the home position return.

# 5.1.5 Actual operation

Start actual operation after confirmation of normal operation by test operation and completion of the corresponding parameter settings.

# 5.1.6 Troubleshooting at start-up

| Never make a drastic adjustment or change to the parameter values as doing so will make the operation upstable |
|--|
| will make the operation unstable.  |

POINT ●Using MR Configurator2, you can refer to the reason for rotation failure, etc.

The following faults may occur at start-up. If any of such faults occurs, take the corresponding action. "MR-JE-\_A" means "MR-JE-\_A Servo Amplifier Instruction Manual".

| No. | Start-up sequence               | Fault  | Investigation  | Possible cause   | Reference           |

|     |   | Large load inertia<br>moment causes the<br>servo motor shaft to<br>oscillate side to side. | If the servo motor may be driven<br>with safety, repeat acceleration<br>and deceleration three times or<br>more to complete the auto<br>tuning.   | Gain adjustment fault                              | MR-JEA<br>Chapter 6 |

Note. Only a list of alarms and warnings is listed in chapter 8. Refer to "MELSERVO-JE Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

## 5.2 Program operation method

## 5.2.1 Program operation method

Select a program created in advance on MR Configurator2 by using an input signal or communication, and start an operation with ST1 (Forward rotation start).

This servo amplifier is set to the absolute value command method by factory setting.

For the position data, you can set the absolute value travel command ("MOV" command), which specifies the target address, and the incremental value travel command ("MOVI" command), which specifies the travel distance. Refer to section 4.2.1 (1) and 5.2.3 (1) (a) for the movable range and the setting unit.

# 5.2.2 Program language

The maximum number of steps of a program is 480. Up to 16 programs can be created; however, the total number of the steps of all programs must be 480 or less.

A set program is selectable by using DI0 (Program No. selection 1) to DI3 (Program No. selection 4).

## (1) Command list

| Command            | Name  | Setting                    | Setting range                              | Unit                             | Indirect<br>specification<br>(Note 7) | Description   |
|--------------------|---|----------------------------|--|----------------------------------|---------------------------------------|---|
| SPN<br>(Note 2)    | Servo motor<br>speed  | SPN (Setting<br>value)     | 0 to permissible<br>instantaneous<br>speed | 3000<br>r/min                    | 0                                     | Set the servo motor command speed for<br>positioning.<br>The setting value must be the permissible<br>instantaneous speed or less of the servo<br>motor used.<br>If the setting value is unspecified, the servo<br>motor rotates at 50 r/min.   |
| STA<br>(Note 2)    | Acceleration<br>time constant                               | STA (Setting<br>value)     | 0 to 20000                                 | ms                               | 0                                     | Set the acceleration time constant. The setting<br>value is a time period which the servo motor<br>takes from a stop to the rated speed.<br>The value cannot be changed during a<br>command output.<br>If the setting value is unspecified, 1000 ms is<br>applied.  |
| STB<br>(Note 2)    | Deceleration<br>time constant                               | STB (Setting<br>value)     | 0 to 20000                                 | ms                               | 0                                     | Set the deceleration time constant. The setting<br>value is a time period which the servo motor<br>takes from the rated speed to a stop.<br>The value cannot be changed during a<br>command output.<br>If the setting value is unspecified, 1000 ms is<br>applied.  |
| STC<br>(Note 2)    | Acceleration/<br>deceleration<br>time constant              | STC (setting<br>value)     | 0 to 20000                                 | ms                               | 0                                     | Set the acceleration/deceleration time<br>constants.<br>The setting value is a time period which the<br>servo motor takes from a stop to the rated<br>speed, and from the rated speed to a stop.<br>When this command is used, the same value<br>is applied for both the acceleration time<br>constant and the deceleration time constant.<br>To set the acceleration/deceleration time<br>constants individually, use the "STA" and<br>"STB" commands.<br>The value cannot be changed during a<br>command output.<br>If the setting value is unspecified, 1000 ms is<br>applied. |
| STD<br>(Note 2, 5) | S-pattern<br>acceleration/d<br>eceleration<br>time constant | STD (Setting<br>value)     | 0 to 1000                                  | ms                               | 0                                     | Set the S-pattern acceleration/deceleration<br>time constants.<br>Set this command to insert S-pattern<br>acceleration/deceleration time constants to the<br>acceleration/deceleration time constants of the<br>program.  |
| MOV                | Absolute<br>value travel<br>command                         | MOV<br>(setting<br>value)  | -999999<br>to 999999<br>(Note 6)           | ×10 <sup>s™</sup> µm<br>(Note 6) | 0                                     | The servo motor rotates using the set value as the absolute value.  |
| MOVA               | Absolute<br>value<br>continuous<br>travel<br>command        | MOVA<br>(setting<br>value) | -9999999<br>to 9999999<br>(Note 6)         | ×10 <sup>s™</sup> µm<br>(Note 6) | 0                                     | The servo motor rotates continuously using<br>the set value as the absolute value. Make sure<br>to describe this command after the "MOV"<br>command.  |

# 5. HOW TO USE THE PROGRAM

| Command              | Name  | Setting                     | Setting range                      | Unit                             | Indirect<br>specification<br>(Note 7) | Description   |
|----------------------|---|-----------------------------|------------------------------------|----------------------------------|---------------------------------------|---|

| FOR<br>NEXT      | Step<br>repeat<br>command           | FOR (setting<br>value)<br>NEXT | 0, 1 to 10000 | times |                                       | The servo motor repeats the operation of the<br>steps, which are set between the "FOR<br>(Setting value)" command and the "NEXT"<br>command, for the set number of times.<br>Setting "0" repeats the program endlessly.<br>Do not describe another set of "FOR" and<br>"NEXT" command between the "FOR" and<br>"NEXT" commands. Otherwise, an error<br>occurs. |
| LPOS<br>(Note 1) | Current<br>position<br>Latch        | LPOS                           |               |       |                                       | Latch the current position at the rising edge of LPS (Current position latch).<br>The latched current position data can be read with communication commands.<br>When the servo motor starts rotating, the latched position varies according to the motor speed and the sampling of input signals.  |
| ТІМ              | Dwell                               | TIM (setting value)            | 1 to 20000    | ms    | 0                                     | Waits for the next step until the set time elapses.  |
| ZRT              | Home<br>position<br>return          | ZRT                            |               |       |                                       | Performs a manual home position return.  |
| TIMES            | Program<br>count<br>command         | TIMES<br>(setting<br>value)    | 0, 1 to 10000 | times | 0                                     | Set the number of program executions by<br>writing "TIMES (setting value)" command at<br>the start of the program. To execute the<br>program only one time, no setting is required.<br>Setting "0" repeats the program endlessly.  |
| STOP             | Program<br>stop                     | STOP                           |               |       |                                       | Stop the running program.<br>Make sure to describe this command in the<br>final line.  |
| TLP<br>(Note 8)  | Forward<br>rotation torque<br>limit | TLP (setting<br>value)         | 0, 1 to 1000  | 0.1 % |                                       | Using the maximum torque as 100%, limit the<br>generated torque of the servo motor in the<br>CCW power running or CW regeneration.<br>The setting value is enabled until the program<br>stops.<br>Specifying the setting value to "0" enables the<br>[Pr. PA11] setting.   |
| TLN<br>(Note 8)  | Reverse<br>rotation torque<br>limit | TLN (setting<br>value)         | 0, 1 to 1000  | 0.1 % |                                       | Using the maximum torque as 100%, limit the<br>generated torque of the servo motor in the CW<br>power running or CCW regeneration.<br>The setting value is enabled until the program<br>stops.<br>Specifying the setting value to "0" enables the<br>[Pr. PA12] setting.   |
| TQL<br>(Note 8)  | Torque limit                        | TQL (setting<br>value)         | 0, 1 to 1000  | 0.1 % |                                       | Using the maximum torque as 100%, limit the generated torque of the servo motor.<br>The setting value is enabled until the program stops.<br>Specifying the setting value to "0" enables the [Pr. PA11] and [Pr. PA12] settings.   |

- Note 1. The "SYNC", "OUTON", "OUTOF", "TRIP", "TRIPI", "COUNT", "LPOS", and "ITP" commands are enabled even during a command output.
  - 2. The "SPN" command is enabled while the "MOV", "MOVA", "MOVI", or "MOVIA" command is executed. The "STA", "STB", "STC", and "STD" commands are enabled while the "MOV" or "MOVI" command is executed.
  - 3. When the on-time is set with [Pr. PT23] to [Pr. PT25], the next command is executed after the set time elapses.
  - 4. When the remaining distance is equal to or less than the set value, or while the servo motor is being stopped or decelerating, the program skips the "ITP" command and proceeds to the next step.
  - 5. The parameter value is enabled normally. However, the value set for the command is enabled after the command is executed until the program stops.
  - 6. The unit of the position command data input can be changed with [Pr. PT01]. For the setting range of each unit, refer to section 5.2.3 (1) (a).
  - 7. For the explanation of the indirect specification, refer to section 5.2.2 (2) (j).
  - 8. The parameter value is enabled normally. However, the value set for the command is enabled after the command is executed until the program stops.

#### (2) Detailed explanations of commands

(a) Positioning conditions (SPN/STA/STB/STC/STD)

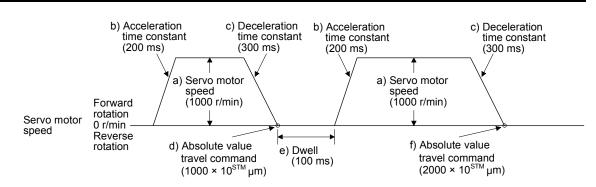

#### POINT

- •Once values are set for the "SPN", "STA", "STB" and "STC" commands, the values are enabled without resetting them. (The values are not initialized at the program startup.) The settings are enabled in the other programs.
- The value set for the "STD" command is enabled in the same program only. The value is initialized to the setting value of [Pr. PC03] at the program startup, and therefore the value is disabled in the other programs.

The "SPN", "STA", "STB", "STC", and "STD" commands are enabled while the "MOV" or "MOVIA command is executed.

When executing two operations with the same servo motor speeds, acceleration time constants, and deceleration time constants while the travel commands are different

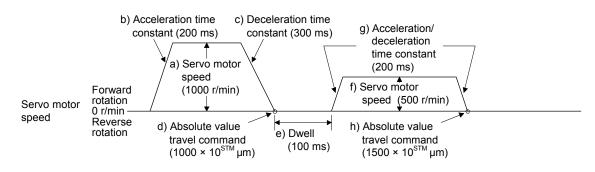

| Command    |                               | Description                 |      |
|------------|-------------------------------|-----------------------------|------|
| SPN (1000) | Servo motor speed             | 1000 [r/min]                | a) 🗋 |
| STA (200)  | Acceleration time constant    | 200 [ms]                    | b)   |
| STB (300)  | Deceleration time constant    | 300 [ms]                    | c)   |
| MOV (1000) | Absolute value travel command | 1000 [×10 <sup>s™</sup> µm] | d) 🔶 |
| TIM (100)  | Dwell                         | 100 [ms]                    | e)   |
| MOV (2000) | Absolute value travel command | 2000 [×10 <sup>s™</sup> µm] | f) 🔶 |
| STOP       | Program stop                  |                             |      |

# 2) Program example 2

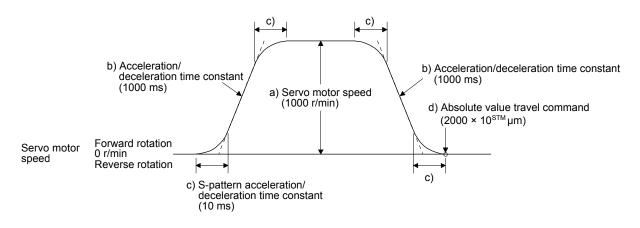

When executing two operations with different servo motor speeds, acceleration time constants, deceleration time constants, and travel commands.

| Command    |   | Description                 |      |
|------------|---|-----------------------------|------|
| SPN (1000) | Servo motor speed                       | 1000 [r/min]                | a)   |
| STA (200)  | Acceleration time constant              | 200 [ms]                    | b)   |
| STB (300)  | Deceleration time constant              | 300 [ms]                    | c)   |
| MOV (1000) | Absolute value travel command           | 1000 [×10 <sup>s™</sup> µm] | d)   |
| TIM (100)  | Dwell                                   | 100 [ms]                    | e)   |
| SPN (500)  | Servo motor speed                       | 500 [r/min]                 | f) ) |
| STC (200)  | Acceleration/deceleration time constant | 200 [ms]                    | g)   |
| MOV (1500) | Absolute value travel command           | 1500 [×10 <sup>s™</sup> µm] | h) 🚄 |
| STOP       | Program stop                            |                             |      |

Using the S-pattern acceleration/deceleration time constants reduces abrupt movements at acceleration or deceleration. When the "STD" command is used, [Pr. PC03 S-pattern acceleration/deceleration time constant] does not function.

| Command    |   | Description                 |      |
|------------|---|-----------------------------|------|
| SPN (1000) | Servo motor speed                                 | 1000 [r/min]                | a) ] |
| STC (100)  | Acceleration/deceleration time constant           | 1000 [ms]                   | b)   |
| STD (10)   | S-pattern acceleration/deceleration time constant | 10 [ms]                     | c) 🗍 |
| MOV (2000) | Absolute value travel command                     | 2000 [×10 <sup>S™</sup> µm] | d)   |
| STOP       | Program stop                                      |                             |      |

(b) Continuous travel commands (MOVA/MOVIA)

POINT •A combination of "MOV" and "MOVIA" commands, and a combination of "MOVI" and "MOVA" commands are not available.

The "MOVA" command is a continuous travel command for the "MOV" command. After the travel with the "MOV" command is executed, the travel with "MOVA" command will be executed continuously without a stop.

The speed specified by the "MOVA command" is enabled from the deceleration start point of the preceding "MOV" or "MOVA" command.

The acceleration/deceleration time constants for the preceding "MOV" command is also applied to those for the "MOVA" command.

The "MOVIA" command is a continuous travel command for the "MOVI" command. After the travel with the "MOVI" command is executed, the travel with "MOVIA" command will be executed continuously without a stop.

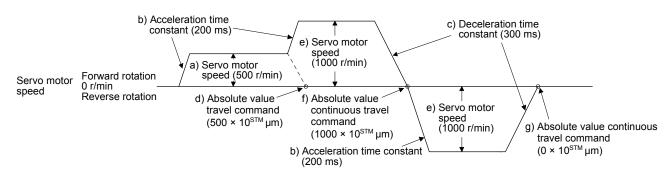

The speed specified by the "MOVIA command" is enabled from the deceleration start point of the preceding "MOVI" or "MOVIA" command.

The acceleration/deceleration time constants for the preceding "MOVI" command is also applied to those for the "MOVIA" command.

| Command | Name  | Setting                  | Unit                 | Description                                 |
|---------|---|--------------------------|----------------------|---|
| MOV     | Absolute value travel<br>command            | MOV<br>(setting value)   | ×10 <sup>s™</sup> µm | Absolute value travel<br>command            |
| MOVA    | Absolute value continuous travel command    | MOVA<br>(setting value)  | ×10 <sup>s™</sup> µm | Absolute value continuous travel command    |
| MOVI    | Incremental value travel command            | MOVI<br>(setting value)  | ×10 <sup>s™</sup> µm | Incremental value travel command            |
| MOVIA   | Incremental value continuous travel command | MOVIA<br>(setting value) | ×10 <sup>s™</sup> µm | Incremental value continuous travel command |

When using the absolute value travel command under the absolute value command method

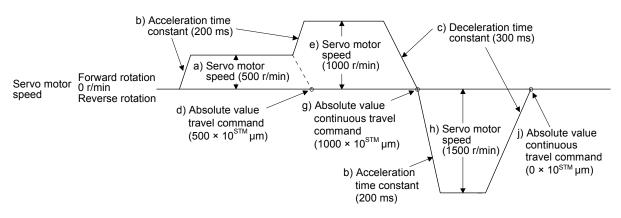

| Command     |  | Description                 |              |
|-------------|--|-----------------------------|--------------|
| SPN (500)   | Servo motor speed                        | 500 [r/min]                 | a)           |
| STA (200)   | Acceleration time constant               | 200 [ms]                    | b) ]         |
| STB (300)   | Deceleration time constant               | 300 [ms]                    | c) 5         |
| MOV (500)   | Absolute value travel command            | 500 [×10 <sup>s™</sup> µm]  | d) •         |
| SPN (1000)  | Servo motor speed                        | 1000 [r/min]                | e)           |
| MOVA (1000) | Absolute value continuous travel command | 1000 [×10 <sup>s™</sup> µm] | f) • • • • • |
| MOVA (0)    | Absolute value continuous travel command | 0 [×10 <sup>s™</sup> µm]    | g) 🚛 🚛       |
| STOP        | Program stop                             |                             |              |

# 2) Program example 2 (Incorrect usage)

For continuous operations, the acceleration time constant and the deceleration time constant cannot be changed for each different speed. Therefore, even if the "STA", "STB", and "STD" commands are written at a speed change, the commands are invalid.

| Command     |  | Description                 |             |
|-------------|--|-----------------------------|-------------|
| SPN (500)   | Servo motor speed                        | 500 [r/min]                 | a)          |
| STA (200)   | Acceleration time constant               | 200 [ms]                    | b) ]        |
| STB (300)   | Deceleration time constant               | 300 [ms]                    | c)          |
| MOV (500)   | Absolute value travel command            | 500 [×10 <sup>s™</sup> µm]  | d)          |
| SPN (1000)  | Servo motor speed                        | 1000 [r/min]                | e)          |
| STC (500)   | Acceleration/deceleration time constant  | 500 [ms]                    | f) Disabled |
| MOVA (1000) | Absolute value continuous travel command | 1000 [×10 <sup>s™</sup> µm] | g) 🛶 🚽      |
| SPN (1500)  | Servo motor speed                        | 1500 [r/min]                | h)          |
| STC (100)   | Acceleration/deceleration time constant  | 100 [ms]                    | i) Disabled |
| MOVA (0)    | Absolute value continuous travel command | 0 [×10 <sup>s™</sup> µm]    | j) .        |
| STOP        | Program stop                             |                             |             |

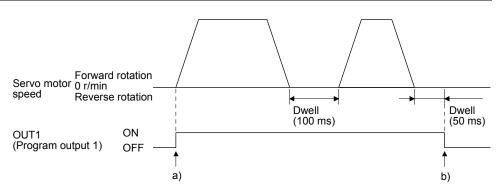

(c) Input/output commands (OUTON/OUTOF) and trip point commands (TRIP/TRIPI)

| POINT  |   |
|--|---|
| ●Using [Pr. P                                  | T23] to [Pr. PT25], you can set the time until OUT1 (Program output |
| 1) to OUT3 (                                   | (Program output 3) are switched off. The commands are switched off  |
| under the fo                                   | llowing conditions.   |
| <ul> <li>The common the common term</li> </ul> | nands are switched off by the OUTOF command.                        |
| <ul> <li>The common the common term</li> </ul> | nands are switched off by a program stop.                           |
| ●The "TRIP" a                                  | and "TRIPI" commands have the following restrictions.               |
| <ul> <li>The "MO\</li> </ul>                   | /" or "MOVA" command cannot be used in combination with the         |
| "TRIPI" co                                     | ommand.   |
| <ul> <li>The "MO\</li> </ul>                   | /I" or "MOVIA" command cannot be used in combination with the       |
| "TRIP" co                                      | mmand.  |
| <ul> <li>The "TRIF</li> </ul>                  | P" and "TRIPI" commands do not execute the next step until the      |
| servo mot                                      | or passes the set address or travel distance. Set the commands      |
| within the                                     | travel command range.   |
| <ul> <li>Whether t</li> </ul>                  | he servo motor has passed the set address or travel distance is     |
| determine                                      | d by checking the actual position (for each command). It is also    |
| determine                                      | d by checking both edges of the address increasing/decreasing       |
| directions                                     |   |

### 1) Program example 1

OUT1 (Program output 1) is switched on upon a program execution. When the program ends, OUT1 (Program output 1) is switched off.

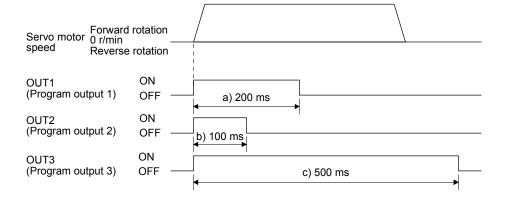

| Command    |                                    | Description                |    |
|------------|------------------------------------|----------------------------|----|
| SPN (1000) | Servo motor speed                  | 1000 [r/min]               |    |
| STA (200)  | Acceleration time constant         | 200 [ms]                   |    |
| STB (300)  | Deceleration time constant         | 300 [ms]                   |    |
| MOV (500)  | Absolute value travel command      | 500 [×10 <sup>s™</sup> µm] |    |
| OUTON (1)  | Switch on OUT1 (Program output 1). |                            | a) |
| TIM (100)  | Dwell                              | 100 [ms]                   |    |
| MOV (250)  | Absolute value travel command      | 250 [×10 <sup>s™</sup> µm] |    |
| TIM (50)   | Dwell                              | 50 [ms]                    |    |
| STOP       | Program stop                       |                            | b) |

Using [Pr. PT23] to [Pr. PT25], you can switch off OUT1 (Program output 1) to OUT3 (Program output 3) automatically.

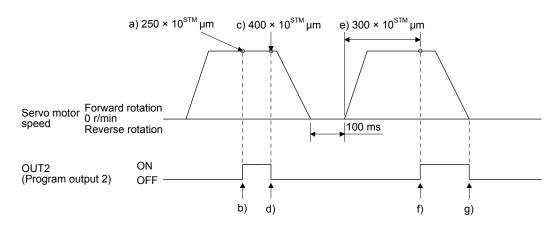

| Parameter | Name                     | Setting value | Description                        |
|-----------|--------------------------|---------------|------------------------------------|
| Pr. PT23  | OUT1 output setting time | 20            | Switch off OUT1 200 [ms] later. a) |
| Pr. PT24  | OUT2 output setting time | 10            | Switch off OUT2 100 [ms] later. b) |
| Pr. PT25  | OUT3 output setting time | 50            | Switch off OUT3 500 [ms] later. c) |

| Command    |                                    | Description                 |
|------------|------------------------------------|-----------------------------|
| SPN (500)  | Servo motor speed                  | 500 [r/min]                 |
| STA (200)  | Acceleration time constant         | 200 [ms]                    |
| STB (300)  | Deceleration time constant         | 300 [ms]                    |
| MOV (1000) | Absolute value travel command      | 1000 [×10 <sup>S™</sup> μm] |
| OUTON (1)  | Switch on OUT1 (Program output 1). |                             |
| OUTON (2)  | Switch on OUT2 (Program output 2). |                             |
| OUTON (3)  | Switch on OUT3 (Program output 3). |                             |
| STOP       | Program stop                       |                             |

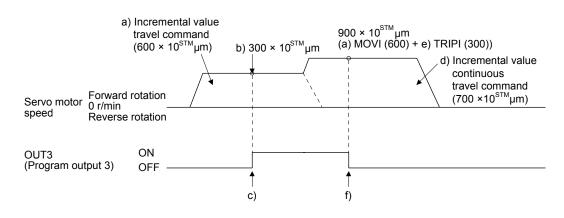

When setting the position address where the "OUTON" or "OUTOF" command is executed by using the "TRIP" or "TRIPI" command

| Command     |  | Description                |    |
|-------------|--|----------------------------|----|
| SPN (1000)  | Servo motor speed                          | 1000 [r/min]               |    |
| STA (200)   | Acceleration time constant                 | 200 [ms]                   |    |
| STB (300)   | Deceleration time constant                 | 1: 300 [ms]                |    |
| MOV (500)   | Absolute value travel command              | 500 [×10 <sup>s™</sup> µm] |    |
| TRIP (250)  | Absolute value trip point specification    | 250 [×10 <sup>s™</sup> µm] | a) |

| OUTON (3)   | Switch on OUT3 (Program output 3).          |                            | c) |
| SPN (700)   | Servo motor speed                           | 700 [r/min]                |    |
| MOVIA (700) | Incremental value continuous travel command | 700 [×10 <sup>s™</sup> µm] | d) |
| TRIPI (300) | Incremental value trip point specification  | 300 [×10 <sup>s™</sup> µm] | e) |
| OUTOF (3)   | Switch off OUT3 (Program output 3).         |                            | f) |
| STOP        | Program stop                                |                            |    |

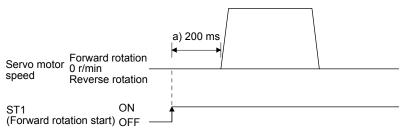

## (d) Dwell (TIM)

Using the "TIM (setting value)" command, set the time from when the remaining distance under the command is "0" until when the next step is executed.

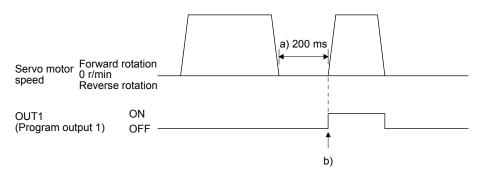

The following shows operation examples of using this command in combination with the other commands for reference.

| 1) Program example 1 |  |
|----------------------|--|
|----------------------|--|

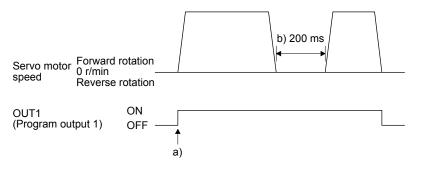

| Command    |   | Description                 |    |
|------------|---|-----------------------------|----|
| TIM (200)  | Dwell                                   | 200 [ms]                    | a) |
| SPN (1000) | Servo motor speed                       | 1000 [r/min]                |    |
| STC (20)   | Acceleration/deceleration time constant | 20 [ms]                     |    |
| MOV (1000) | Absolute value travel command           | 1000 [×10 <sup>s™</sup> µm] |    |
| STOP       | Program stop                            |                             |    |

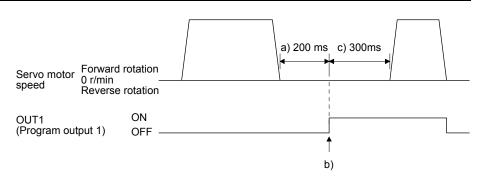

| Command     |   | Description                 |    |
|-------------|---|-----------------------------|----|
| SPN (1000)  | Servo motor speed                       | 1000 [r/min]                |    |
| STC (20)    | Acceleration/deceleration time constant | 20 [ms]                     |    |
| MOVI (1000) | Incremental value travel command        | 1000 [×10 <sup>s™</sup> µm] |    |
| TIM (200)   | Dwell                                   | 1: 200 [ms]                 | a) |
| OUTON (1)   | Switch on OUT1 (Program output 1).      |                             | b) |
| MOVI (500)  | Incremental value travel command        | 500 [×10 <sup>s™</sup> µm]  |    |
| STOP        | Program stop                            |                             |    |

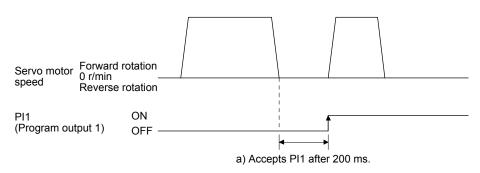

| Command     |   | Description                 |    |
|-------------|---|-----------------------------|----|
| SPN (1000)  | Servo motor speed                       | 1000 [r/min]                |    |
| STC (20)    | Acceleration/deceleration time constant | 20 [ms]                     |    |

| TIM (300)   | Dwell                                   | 300 [ms]                    | c) |
| MOVI (500)  | Incremental value travel command        | 500 [×10 <sup>s™</sup> µm]  |    |
| STOP        | Program stop                            |                             |    |

| Command     |   | Description                 |    |
|-------------|---|-----------------------------|----|
| SPN (1000)  | Servo motor speed                         | 1000 [r/min]                |    |
| STC (20)    | Acceleration/deceleration time constant   | 20 [ms]                     |    |
| MOVI (1000) | Incremental value travel command          | 1000 [×10 <sup>s™</sup> µm] |    |
| TIM (200)   | Dwell                                     | 200 [ms]                    | a) |
| SYNC (1)    | Suspend the step until PI1 (Program input | t) is switched on.          |    |
| MOVI (500)  | Incremental value travel command          | 500 [×10 <sup>s™</sup> µm]  |    |
| STOP        | Program stop                              |                             |    |

| Command     |  | Description                 |    |
|-------------|--|-----------------------------|----|
| SPN (1000)  | Servo motor speed                        | 1000 [r/min]                |    |
| STC (20)    | Acceleration/deceleration time constant  | 20 [ms]                     |    |
| MOVI (1000) | Incremental value travel command         | 1000 [×10 <sup>s™</sup> µm] |    |
| SYNC (1)    | Suspend the step until PI1 (Program inpu | t) is switched on.          |    |
| TIM (200)   | Dwell                                    | 200 [ms]                    | a) |
| MOVI (500)  | Incremental value travel command         | 500 [×10 <sup>s™</sup> µm]  |    |
| STOP        | Program stop                             |                             |    |

(e) Interrupt positioning (ITP)

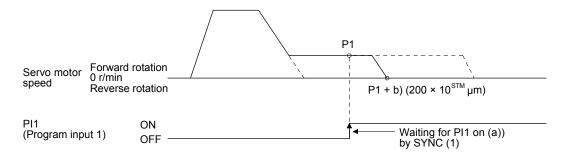

| POINT                        |   |
|------------------------------|---|
| For positioni                | ng with the ITP command, the stop position varies depending on the    |
| servo motor                  | speed when the "ITP" command becomes enabled.                         |
| In the follow                | ing cases, the program does not execute the "ITP" command and         |
| proceeds to                  | the next step.  |
| <ul> <li>When the</li> </ul> | setting value of the "ITP" command is smaller than that of the travel |

- command set by the "MOV", "MOVI", "MOVA" or "MOVIA" command
  When the remaining distance is equal to or less than the travel distance specified by the "ITP" command
- While the servo motor is decelerating

When an "ITP" command is used in the program, starting from the position where PI1 (Program input 1) to PI3 (Program input 3) are switched on, the servo motor rotates for a distance of the set value and stops.

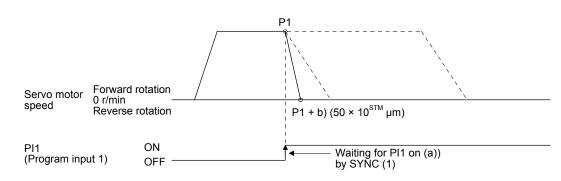

When using the "ITP" command, make sure to describe the "SYNC" command right before the "ITP" command.

| Command    | Description                            |                            |    |
|------------|--|----------------------------|----|
| SPN (500)  | Servo motor speed                      | 500 [r/min]                |    |
| STA (200)  | Acceleration time constant             | 200 [ms]                   |    |
| STB (300)  | Deceleration time constant             | 300 [ms]                   |    |
| MOV (600)  | Absolute value travel command          | 600 [×10 <sup>s™</sup> µm] |    |
| SPN (100)  | Servo motor speed                      | 100 [r/min]                |    |
| MOVA (600) | Continuous travel command              | 600 [×10 <sup>s™</sup> µm] |    |
| SYNC (1)   | Suspend the step until PI1 (Program ir | nput) is switched on.      | a) |
| ITP (200)  | Interrupt positioning                  | 200 [×10 <sup>s™</sup> µm] | b) |
| STOP       | Program stop                           |                            |    |

When the travel distance set by the "ITP" command is smaller than the travel distance required for deceleration, the actual deceleration time constant becomes smaller than the setting value of the "STB" command.

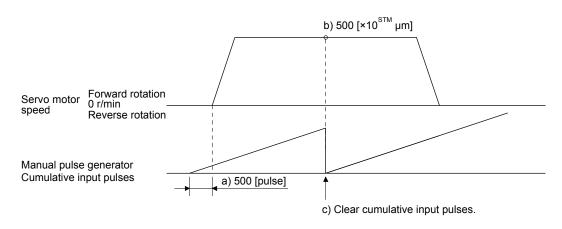

| Command    |  | Description                 |    |
|------------|--|-----------------------------|----|
| SPN (500)  | Servo motor speed                      | 500 [r/min]                 |    |
| STA (200)  | Acceleration time constant             | 200 [ms]                    |    |
| STB (300)  | Deceleration time constant             | 300 [ms]                    |    |
| MOV (1000) | Absolute value travel command          | 1000 [×10 <sup>s™</sup> µm] |    |
| SYNC (1)   | Suspend the step until PI1 (Program ir | nput) is switched on.       | a) |
| ITP (50)   | Interrupt positioning                  | 50 [×10 <sup>s™</sup> µm]   | b) |
| STOP       | Program stop                           |                             |    |

# (f) External pulse count (COUNT)

When the number of input pulses of the manual pulse generator becomes larger than the value set for the "COUNT" command, the next step is executed. Setting "0" clears the cumulative input pulses.

| Command     | Description   |                             |    |
|-------------|---|-----------------------------|----|
| COUNT (500) | Wait for the next step until the number of input pulses of the manual pulse generator reaches 500 |                             |    |
|             | [pulse].  |                             | a) |
| SPN (500)   | Servo motor speed   | 500 [r/min]                 |    |
| STA (200)   | Acceleration time constant  | 200 [ms]                    |    |
| STB (300)   | Deceleration time constant  | 300 [ms]                    |    |
| MOV (1000)  | Absolute value travel command   | 1000 [×10 <sup>s™</sup> µm] |    |
| TRIP (500)  | Trip point specification  | 500 [×10 <sup>s™</sup> µm]  | b) |
| COUNT (0)   | Clear cumulative input pulses.  |                             | c) |
| STOP        | Program stop  |                             |    |

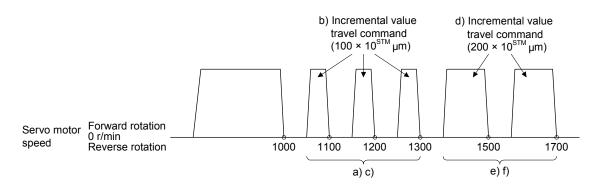

# (g) Step repeat command (FOR...NEXT)

| POINT       |   |
|-------------|---|
| ●You cannot | nsert "FORNEXT" commands between the "FOR" and "NEXT" |
| commands.   |   |

The servo motor repeats the operation of the steps, which are set between the "FOR (Setting value) and the "NEXT" commands. Setting "0" repeats the program endlessly.

For how to stop the program, which has been repeated endlessly, refer to section 5.2.4 (4).

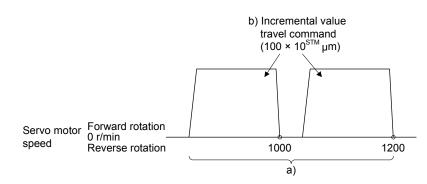

| Command    |   | Description                 |    |
|------------|---|-----------------------------|----|
| SPN (1000) | Servo motor speed                       | 1000 [r/min]                |    |
| STC (20)   | Acceleration/deceleration time constant | 20 [ms]                     |    |
| MOV (1000) | Absolute value travel command           | 1000 [×10 <sup>s™</sup> µm] |    |
| TIM (100)  | Dwell                                   | 100 [ms]                    |    |
| FOR (3)    | Start of step repeat command            | 3 [time]                    | a) |
| MOVI (100) | Incremental value travel command        | 100 [×10 <sup>s™</sup> µm]  | b) |
| TIM (100)  | Dwell                                   | 100 [ms]                    |    |
| NEXT       | End of step repeat command              |                             | c) |
| FOR (2)    | Start of step repeat command            | 2 [time]                    | d) |
| MOVI (200) | Incremental value travel command        | 200 [×10 <sup>s™</sup> µm]  | e) |
| TIM (100)  | Dwell                                   | 100 [ms]                    |    |
| NEXT       | End of step repeat command              | -                           | f) |
| STOP       | Program stop                            |                             |    |

(h) Number of program executions command (TIMES)

A program can be executed repeatedly by setting the number of program executions in the "TIMES (setting value) command" placed at the start of the program. To execute the program one time, the "TIMES" command is not required. Setting "0" repeats the program endlessly. For how to stop the program, which has been repeated endlessly, refer to section 5.2.4 (4).

| Command     |   | Description                 |    |
|-------------|---|-----------------------------|----|
| TIMES (2)   | Number of program executions command    | 2 [time]                    | a) |
| SPN (1000)  | Servo motor speed                       | 1000 [r/min]                |    |
| STC (20)    | Acceleration/deceleration time constant | 20 [ms]                     |    |
| MOVI (1000) | Incremental value travel command        | 1000 [×10 <sup>s™</sup> µm] | b) |
| TIM (100)   | Dwell                                   | 100 [ms]                    |    |
| STOP        | Program stop                            |                             |    |

The current position upon switch-on of LPS (Current position latch input) is stored. The stored position data can be read with the communication function.

The current position latch function, which is set during the execution of the program, will be canceled when the program ends. The function is also canceled with an operation mode change, forced stop, alarm occurrence, or servo-off. The function will not be canceled by only a temporary stop.

| Command    |                               | Description                 |  |
|------------|-------------------------------|-----------------------------|--|
| SPN (500)  | Servo motor speed             | 500 [r/min]                 |  |
| STA (200)  | Acceleration time constant    | 200 [ms]                    |  |
| STB (300)  | Deceleration time constant    | 300 [ms]                    |  |
| MOV (1000) | Absolute value travel command | 1000 [×10 <sup>s™</sup> μm] |  |
| LPOS       | Set a current position latch. | a)                          |  |
| STOP       | Program stop                  |                             |  |

(j) Indirect specification with general purpose registers (R1-R4, D1-D4)

You can indirectly specify the setting values of the "SPN", "STA", "STB", "STC", "STD", "MOV", "MOVI", "MOVA", "MOVIA", "TIM", and "TIMES" commands.

The value, which is stored in each general purpose register (R1-R4, D1-D4), is used as the setting value of each command.

Change the general purpose registers by using MR Configurator2 or a communication command while the program is not executed by a communication command

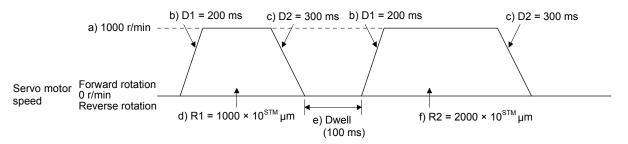

The data of the general purpose registers is erased at power-off of the servo amplifier. Note that the data of the general purpose registers (R1-R4) can be stored in EEP-ROM.

The setting range of each general purpose register is that of the command for which each register is used.

The following explains a case where the general purpose registers are set as shown below before the execution of the program.

| General purpose register | Setting |
|--------------------------|---------|
| R1                       | 1000    |
| R2                       | 2000    |
| D1                       | 200     |
| D2                       | 300     |

| Command    | Description                      |                                  |    |  |  |
|------------|----------------------------------|----------------------------------|----|--|--|
| SPN (1000) | Servo motor speed                | 1000 [r/min]                     | a) |  |  |
| STA (D1)   | Acceleration time constant       | D1 = 200 [ms]                    | b) |  |  |
| STB (D2)   | Deceleration time constant       | D2 = 300 [ms]                    | c) |  |  |
| MOVI (R1)  | Incremental value travel command | R1 = 1000 [×10 <sup>S™</sup> µm] | d) |  |  |
| TIM (100)  | Dwell                            | 100 [ms]                         | e) |  |  |
| MOVI (R2)  | Incremental value travel command | R2 = 2000 [×10 <sup>S™</sup> µm] | f) |  |  |
| STOP       | Program stop                     |                                  |    |  |  |

(k) Home position return command (ZRT)

Performs a home position return.

Set the home position with parameters. (Refer to section 5.4.)

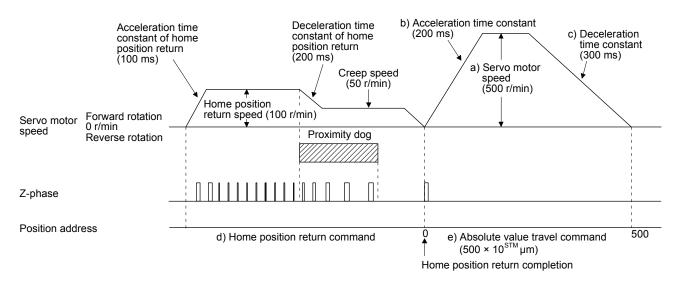

With the "ZRT" command, the program proceeds to the next step after the home position return completion.

POINT

If the home position return has not completed successfully, [AL. 96 Home position return incomplete warning] occurs. In this case, the program proceeds to the next step without a stop. Since the home position return is incomplete, the travel command is disabled.

| Command   | Description                   |                            |    |  |  |
|-----------|-------------------------------|----------------------------|----|--|--|
| SPN (500) | Servo motor speed             | 500 [r/min]                | a) |  |  |
| STA (200) | Acceleration time constant    | 200 [ms]                   | b) |  |  |
| STB (300) | Deceleration time constant    | 300 [ms]                   | c) |  |  |
| ZRT       | Home position return          |                            | d) |  |  |
| MOV (500) | Absolute value travel command | 500 [×10 <sup>s™</sup> µm] | e) |  |  |
| STOP      | Program stop                  |                            |    |  |  |

| Item   | Parameter to be used | Setting   |
|--|----------------------|---|
| Dog type home position return                      | [Pr. PT04]           | " 0"  |
| Home position return direction                     | [Pr. PT04]           | "0_" (Address increasing direction)               |
| Dog input polarity                                 | [Pr. PT29]           | "1" (Detects dog when DOG (proximity dog) is on.) |
| Home position return speed                         | [Pr. PT05]           | 100 [r/min]                                       |
| Creep speed  | [Pr. PT06]           | 50 [r/min]  |
| Home position shift distance                       | [Pr. PT07]           | 0 [×10 <sup>S™</sup> µm]                          |
| Acceleration time constant of home position return | [Pr. PC30]           | 100 [ms]  |
| Deceleration time constant of home position return | [Pr. PC31]           | 200 [ms]  |
| Home position return position data                 | [Pr. PT08]           | 0   |

(I) Torque limit value switching (TLP/TLN/TQL)Using the maximum torque as 100.0%, limit the generated torque of the servo motor.

| Command    |  | Description                 |    |
|------------|--|-----------------------------|----|
| SPN (1500) | Servo motor speed                      | 1500 [r/min]                |    |
| STA (100)  | Acceleration time constant             | 100 [ms]                    |    |
| STB (200)  | Deceleration time constant             | 1: 200 [ms]                 |    |
| MOV (1000) | Absolute value travel command          | 10 <sup>s™</sup> µm         |    |
| SYNC (1)   | Suspend the step until PI1 (Program in | nput) is switched on.       | a) |
| TLP (800)  | Forward rotation torque limit          | 800 [0.1%]                  | b) |

|                               |  |                               | _1                 | [inch]                    | -999999 to 999999 [×10 <sup>(STM-4)</sup> inch] |
|                               |  |                               | _2                 | [degree]                  | -999.999 to 999.999                             |
|                               |  |                               | _3                 | [pulse]                   | -999999 to 999999                               |
|                               | Incremental value<br>travel command<br>("MOVI", "MOVIA") | 1                             | _0                 | [mm]                      | -999999 to 999999 [×10 <sup>s™</sup> µm]        |
| Incremental value             |  |                               | _1                 | [inch]                    | -999999 to 999999 [×10 (STM-4) inch]            |
| command method                |  |                               | _2                 | [degree]                  | -999.999 to 999.999                             |
|                               |  |                               | _3                 | [pulse]                   | -999999 to 999999                               |

(c) Rotation direction selection/travel direction selection ([Pr. PA14])
 Select the servo motor rotation direction when ST1 (Forward rotation start) is switched on.

| [Pr. PA14] setting   | Servo motor rotation direction when ST1 (Forward rotation start) is switched on |  |
|----------------------|---|--|
| 0<br>(initial value) | CCW rotation with + position data<br>CW rotation with - position data           |  |
| 1                    | CW rotation with + position data<br>CCW rotation with - position data           |  |

## (c) Feed length multiplication ([Pr. PT03])

Set the feed length multiplication factor (STM) of the position data.

| [Pr. PT03] setting   | Position data input range |                     |                     |                   |  |
|----------------------|---------------------------|---------------------|---------------------|-------------------|--|
| [FI. FI03] Setting   | [mm]                      | [inch]              | [degree] (Note)     | [pulse] (Note)    |  |
| 0<br>(initial value) | -999.999 to 999.999       | -99.9999 to 99.9999 |                     |                   |  |
| 1                    | -9999.99 to 9999.99       | -999.999 to 999.999 | -360.000 to 360.000 | -999999 to 999999 |  |
| 2                    | -99999.9 to 99999.9       | -9999.99 to 9999.99 |                     |                   |  |
| 3                    | -999999 to 999999         | -99999.9 to 99999.9 |                     |                   |  |

Note. The feed length multiplication setting ([Pr. PT03]) is not applied to the unit multiplication factor. Adjust the unit multiplication factor in the electronic gear setting ([Pr. PA06] and [Pr. PA07]).

### (2) Signal

Selecting a program with DI0 to DI3 and switching on ST1 perform the positioning operation according to the set program. At this time, ST2 (Reverse rotation start) is disabled.

| Item  | Device to be used  | Setting   |
|---|--|---|
| Program operation method selection MD0 (Operation mode selection 1) |  | Switch on MD0.                                  |
| Program selection   | DI0 (Program No. selection 1)<br>DI1 (Program No. selection 2)<br>DI2 (Program No. selection 3)<br>DI3 (Program No. selection 4) | Refer to section 2.3 (1).                       |
| Start   | ST1 (Forward rotation start)   | Switch on ST1 to execute the program operation. |

## 5.2.4 Timing chart of the program operation

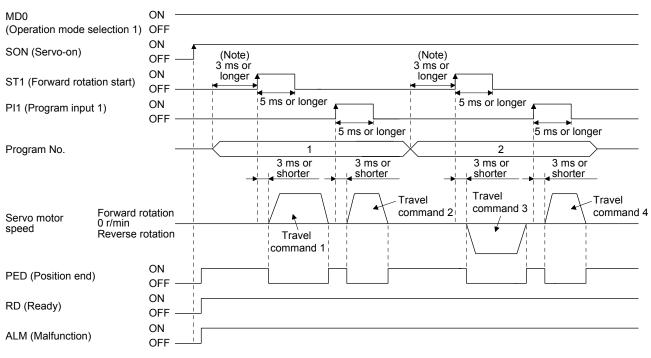

#### (1) Operation condition

The following shows a timing chart when the program below is executed after the home position return completion under the absolute value command method.

| Program No. |   | Description  |                  |  |  |  |
|-------------|---|--|------------------|--|--|--|
| SPN (1000)  | Servo motor speed                         | 1000 [r/min]   |                  |  |  |  |
| STC (100)   | Acceleration/deceleration time constant   | 100 [ms]   |                  |  |  |  |
| MOV (5000)  | Absolute value travel command             | 5000 [×10 <sup>s™</sup> µm]                                | Travel command 1 |  |  |  |
| SYNC (1)    | Suspend the step until PI1 (Program input | Suspend the step until PI1 (Program input) is switched on. |                  |  |  |  |
| STC (50)    | Acceleration/deceleration time constant   | 50 [ms]  |                  |  |  |  |

#### (2) Timing chart

Note. The detection of external input signals is delayed by the time set in the input filter setting of [Pr. PD29]. Considering the output signal sequence from the controller and signal variations due to hardware, configure a sequence that changes the program selection earlier.

## (3) Temporary stop/restart

When TSTP is switched on during the automatic operation, deceleration is performed using the deceleration time constant under the executing travel command to make a temporary stop. An operation for the remaining distance will be started by switching TSTP off and on (on-edge detection). ST1 (Forward rotation start) does not function even if it is switched on during the temporary stop. When the operation mode is switched from the automatic mode to the manual mode during the temporary stop, the remaining travel distance will be cleared, and the program will end. Switching on TSTP again will not restart the program. To start the program, switch on ST1 (Forward rotation start) again. The temporary stop/restart input does not function during a home position return or JOG operation. The timing chart is the same as that of the point table operation mode. Refer to section 4.2.2 (3) (e).

## (4) How to stop the program

To stop the program in execution, switch on TSTP (Temporary stop/restart) to stop the positioning operation, and then switch on CR (Clear). At this time, the remaining distance will be cleared, and the program will end.

Switching on TSTP again will not restart the positioning operation. To start the program, switch on ST1 (Forward rotation start) again.

## (5) Program termination condition

The following shows the conditions for terminating the program in execution.

| Termination condition  | Restart condition  |
|--|--|
| Execution of STOP (Program stop)   | Switch on ST1 (Forward rotation start). The program starts from the beginning.   |
| When the automatic operation mode is switched to the manual operation mode | After switching to the automatic operation mode, switch on ST1. The program starts from the beginning.                     |
| When the hardware stroke limit is detected                                 | After LSP and LSN are switched on, switch on ST1. The program starts from the beginning.                                   |
| When the software stroke limit is detected ([Pr. PT15] to [Pr. PT18])      | After the machine travels to within the software stroke limit range, switch on ST1. The program starts from the beginning. |
| At base circuit shut-off   | After resetting the base circuit shut-off, switch on ST1. The program starts from the beginning.                           |

# 5.3 Manual operation mode

For the machine adjustment, home position adjustment, and others, you can shift the position to any position with a JOG operation or manual pulse generator.

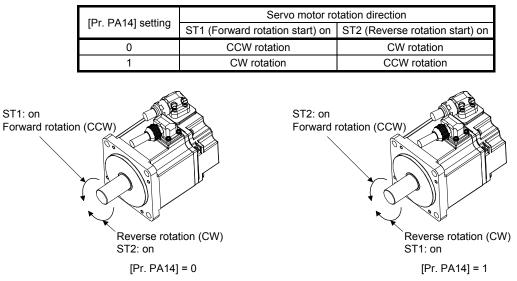

# 5.3.1 JOG operation

(1) Setting

According to the purpose of use, set input signals and parameters as shown below. At this time, DI0 (Program No. selection 1) to DI3 (Program No. selection 4) are disabled.

| Item  | Device/parameter to be used      | Setting   |
|---|----------------------------------|---|
| Manual operation mode selection                         | MD0 (Operation mode selection 1) | Switch off MD0.   |
| Servo motor rotation direction                          | [Pr. PA14]                       | Refer to (2) of this section.                               |
| JOG speed   | [Pr. PT13]                       | Set the servo motor speed.                                  |
| Acceleration time constant                              | [Pr. PC01]                       | Set the acceleration time constant.                         |
| Deceleration time constant                              | [Pr. PC02]                       | Set the deceleration time constant.                         |
| S-pattern<br>acceleration/deceleration time<br>constant | [Pr. PC03]                       | Set the S-pattern acceleration/deceleration time constants. |

## (2) Servo motor rotation direction

(3) Operation

When ST1 is switched on, the servo motor rotates using the JOG speed set in [Pr. PT13] and the acceleration/deceleration constants set with [Pr. PC02] and [Pr. PC03]. For the rotation direction, refer to (2) of this section. Switching on ST2 rotates the servo motor opposite to the direction of ST1 (Forward rotation start).

# 5. HOW TO USE THE PROGRAM

### (4) Timing chart

#### 5.3.2 Manual pulse generator operation

## (1) Setting

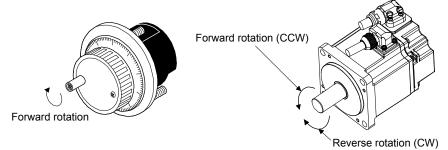

POINT
 ●To enhance noise tolerance, set "\_ 2\_ \_" to [Pr. PA13] when the command pulse frequency is 500 kpulses/s or less, or set "\_3\_ \_" to [Pr. PA13] when the command pulse frequency is 200 kpulses/s or less.

According to the purpose of use, set input signals and parameters as shown below. At this time, DI0 (Program No. selection 1) to DI3 (Program No. selection 4) are disabled.

| Item                                    | Device/parameter to be used      | Setting  |
|---|----------------------------------|--|
| Manual operation mode selection         | MD0 (Operation mode selection 1) | Switch off MD0.  |
| Manual pulse generator multiplication   | [Pr. PT03]                       | Set the multiplication factor for the pulses<br>generated from the manual pulse generator.<br>For details, refer to (3) of this section. |
| Servo motor rotation direction          | [Pr. PA14]                       | Refer to (2) of this section.  |
| Command input pulse train<br>input form | [Pr. PA13]                       | Set "2" (A/B-phase pulse train).   |
| Pulse train filter selection            | [Pr. PA13]                       | Set other than "_0" and "_1".  |

(2) Servo motor rotation direction

|                    | Servo motor rotation direction                        |   |  |  |
|--------------------|---|---|--|--|
| [Pr. PA14] setting | Manual pulse generator<br>operation: forward rotation | Manual pulse generator<br>operation: reverse rotation |  |  |
| 0                  | CCW rotation  | CW rotation   |  |  |
| 1                  | CW rotation   | CCW rotation  |  |  |

(3) Manual pulse generator multiplication

(a) Setting with input signals

In "Device Setting" of MR Configurator2, set TP0 (Manual pulse generator multiplication 1) and TP1 (Manual pulse generator multiplication 2) for input signals.

| TP1 (Pulse generator        |                             | Servo motor rotation multiplication                  |       | Travel of | distance |         |
|-----------------------------|-----------------------------|--|-------|-----------|----------|---------|
| multiplication 2)<br>(Note) | multiplication 1)<br>(Note) | factor for manual pulse generator<br>rotation amount | [mm]  | [inch]    | [degree] | [pulse] |
| 0                           | 0                           | [Pr. PT03] setting enabled                           |       |           |          | /       |
| 0                           | 1                           | 1 time   | 0.001 | 0.0001    | 0.001    | 1       |
| 1                           | 0                           | 10 times   | 0.01  | 0.001     | 0.01     | 10      |
| 1                           | 1                           | 100 times  | 0.1   | 0.01      | 0.1      | 100     |

Note. 0: Off

1: On

(b) Using the parameter for setting

Using [Pr. PT03], set the servo motor rotation multiplication factor for the rotation amount of the manual pulse generator.

| [Dr. DT02] potting | Servo motor rotation multiplication to manual pulse |       | Travel distance |          |         |  |  |
|--------------------|---|-------|-----------------|----------|---------|--|--|
| [Pr. PT03] setting | generator rotation amount                           | [mm]  | [inch]          | [degree] | [pulse] |  |  |
| 0_                 | 1 time  | 0.001 | 0.0001          | 0.001    | 1       |  |  |
| 1_                 | 10 times  | 0.01  | 0.001           | 0.01     | 10      |  |  |
| 2_                 | 100 times   | 0.1   | 0.01            | 0.1      | 100     |  |  |

(4) Operation

Turning the manual pulse generator rotates the servo motor. For the rotation direction of the servo motor, refer to (2) of this section.

# 5.4 Home position return mode

| POINT   |
|---|
| Before performing the home position return, make sure that the limit switch   |
| operates.   |
| ●Check the home position return direction. An incorrect setting will cause a  |
| reverse running.  |
| ●Chek the proximity dog input polarity. Otherwise, it may cause an unexpected |
| operation.  |

## 5.4.1 Outline of home position return

A home position return is performed to match the command coordinates with the machine coordinates. The home position return is required every time the input power is on.

This section shows the home position return methods of the servo amplifier. Select the optimum method according to the configuration and uses of the machine.

This servo amplifier has the home position return automatic retract function. When the machine stops beyond or on a proximity dog, this function automatically moves the machine back to the proper position to perform the home position return. Manual operation with JOG operation, etc. is unnecessary.

#### (1) Home position return types

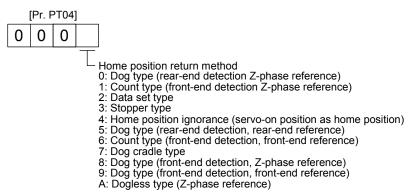

Select the optimum home position return type according to the machine type or others.

| Туре   | Home position return method  | Feature  |
|--|--|--|
| Dog type   | Deceleration starts from the front end of the<br>proximity dog. After the rear end is passed,<br>the position specified by the first Z-phase<br>signal, or the position of the first Z-phase<br>signal shifted by the specified home position<br>shift distance is used as the home position.<br>The servo amplifier internally recognizes the<br>Z-phase signal one time per servo motor<br>revolution. The Z-phase signal cannot be<br>used as an output signal. | <ul> <li>Typical home position return method using a proximity dog</li> <li>The repeatability of the home position return is high.</li> <li>The machine is less loaded.</li> <li>Use this when the width of the proximity dog can be set equal to or greater than the deceleration distance of the servo motor.</li> </ul> |
| Count type   | Deceleration starts from the front end of the<br>proximity dog. After the front end is passed,<br>the position specified by the first Z-phase<br>signal after the set distance or the position<br>of the Z-phase signal shifted by the set<br>home position shift distance is set as a<br>home position.   | <ul> <li>This is a home position return method using a proximity dog.</li> <li>Use this to minimize the length of the proximity dog.</li> </ul>  |
| Data set type  | The position shifted by any distance manually is used as the home position.  | No proximity dog is required.  |
| Stopper type   | A workpiece is pressed against a mechanical stopper, and the position where it is stopped is set as the home position.   | <ul> <li>Since the workpiece collides with the mechanical stopper, the home position return speed must be low enough.</li> <li>The strength of the machine and stopper must be increased.</li> </ul>   |
| Home position ignorance<br>(servo-on position as home<br>position) | The position at servo-on is used as the home position.   |  |
| Dog type rear end reference  | Deceleration starts from the front end of the<br>proximity dog. After the rear end is passed,<br>the position is shifted by the travel distance<br>after proximity dog and the home position<br>shift distance. The position after the shifts is<br>used as the home position.   | The Z-phase signal is not required.  |
| Count type front end reference                                     | Deceleration starts from the front end of the<br>proximity dog. The position is shifted by the<br>travel distance after proximity dog and the<br>home position shift distance. The position<br>after the shifts is used as the home position.  | The Z-phase signal is not required.  |
| Dog cradle type  | After the front end of the proximity dog is<br>detected, the position specified by the first<br>Z-phase signal is used as the home<br>position.  |  |
| Dog type last Z-phase<br>reference                                 | After the front end of the proximity dog is<br>detected, the position is shifted away from<br>the proximity dog in the reverse direction.<br>Then, the position specified by the first Z-<br>phase signal or the position of the first Z-<br>phase signal shifted by the home position<br>shift distance is used as the home position.   |  |
| Dog type front end reference                                       | Starting from the front end of the proximity<br>dog, the position is shifted by the travel<br>distance after proximity dog and the home<br>position shift distance. The position after the<br>shifts is used as the home position.   | <ul> <li>The Z-phase signal is not required.</li> </ul>  |
| Dogless Z-phase reference  | The position specified by the first Z-phase<br>signal, or the position of the first Z-phase<br>signal shifted by the home position shift<br>distance is used as the home position.   |  |

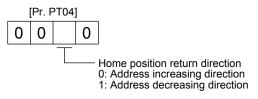

#### (2) Parameters for home position return

To perform the home position return, set each parameter as follows.

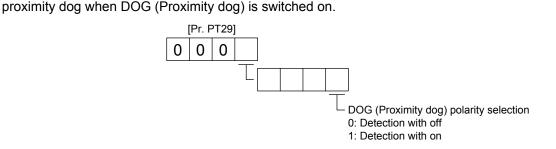

(a) Select the home position return type with [Pr. PT04 Home position return type].

(b) Select the starting direction for the home position return with [Pr. PT04 Home position return type]. Setting "0" starts the home position return in a direction of increasing the address from the current position. Setting "1" starts the home position return in a direction of decreasing the address from the current position.

(c) Select the polarity where the proximity dog is detected with the DOG (Proximity dog) polarity selection of [Pr. PT29 Function selection T-3].
 Setting "0" detects a proximity dog when DOG (Proximity dog) is switched off. Setting "1" detects a

(3) Program example

Select a program containing a "ZRT" command, which performs the home position return.

#### 5.4.2 Dog type home position return

This is a home position return method using a proximity dog. Deceleration starts at the front end of the proximity dog. After the rear end is passed, the position specified by the first Z-phase signal, or the position of the first Z-phase signal shifted by the specified home position shift distance is used as the home position.

#### (1) Device/parameter

Set input devices and parameters as follows:

| Item   | Device/parameter to be used                                       | Setting  |
|--|---|--|
| Automatic operation mode of the program method     | MD0 (Operation mode selection 1)                                  | Switch on MD0.   |
| Dog type home position return                      | [Pr. PT04]  | 0: Select dog type (rear end detection Z-<br>phase reference)  |
| Home position return direction                     | [Pr. PT04]  | Refer to section 5.4.1 (2) to select the home position return direction.   |
| Dog input polarity                                 | [Pr. PT29]  | Refer to section 5.4.1 (2) to select the dog input polarity.   |
| Home position return speed                         | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.  |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.  |
| Home position shift distance                       | [Pr. PT07]  | Set this to shift the home position, which is specified by the first Z-phase signal after the rear end of the proximity dog is passed. |
| Acceleration time constant of home position return | [Pr. PC30]  | The acceleration time constant set for [Pr. PC30] is used.   |
| Deceleration time constant of home position return | [Pr. PC31]  | The deceleration time constant set for [Pr. PC31] is used.   |
| Home position return position data                 | [Pr. PT08]  | Set the current position when the home position return completed.  |
| Program  | DI1 (Program No. selection 1) to<br>DI3 (Program No. selection 4) | Select a program containing a "ZRT" command, which performs the home position return.  |

#### (2) Length of the proximity dog

To generate the Z-phase signal of the servo motor during the detection of DOG (Proximity dog), set the length of the proximity dog that satisfies equations (5.1) and (5.2).

$$L_1 \ge \frac{V}{60} \cdot \frac{td}{2}$$
(5.1)

L<sub>1</sub>: Length of the proximity dog [mm]

V: Home position return speed [mm/min]

td: Deceleration time [s]

L<sub>2</sub>: Length of the proximity dog [mm]

 $\Delta S$ : Travel distance per servo motor revolution [mm]

#### (3) Timing chart

The following shows a timing chart after a program containing a "ZRT" command is selected.

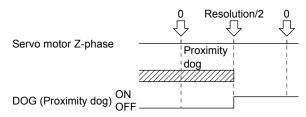

| MD0                              | ON                   |                       |   |                                    |                  |
|----------------------------------|----------------------|-----------------------|---|------------------------------------|------------------|
| (Operation mode selection 1      | ) OFF                |                       |   |                                    |                  |
| MEND (Travel completion)         | ON<br>OFF            | ]                     |   |                                    |                  |

| DOG (Proximity dog)              | ON<br>OFF            |                       |   |                                    |                  |
| ST1 (Forward rotation start)     | ON<br>OFF            | 5 ms or longer        |   |                                    |                  |
| ST2 (Reverse rotation start)     | ON<br>OFF            |                       |   |                                    |                  |

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

(4) Adjustment

For the dog type home position return, adjust the setting so that the Z-phase signal is always generated during the detection of a dog. Make an adjustment so that the rear end of DOG (Proximity dog) is positioned almost at the center between the positions specified by a Z-phase signal and the next Z-phase signal.

The generation position of the Z-phase signal can be checked with "Position within one-revolution" of "Status Display" on MR Configurator2.

#### 5.4.3 Count type home position return

For the count type home position return, after the front end of the proximity dog is detected, the position is shifted by the distance set in [Pr. PT09 Travel distance after proximity dog]. Then, the position specified by the first Z-phase signal is used as the home position. Therefore, when the on-time of DOG (Proximity dog) is 10 ms or more, the length of the proximity dog has no restrictions. Use the count type home position return when you cannot use the dog type home position return because the length of the proximity dog cannot be reserved, when you input DOG (Proximity dog) electrically from the controller, or other cases.

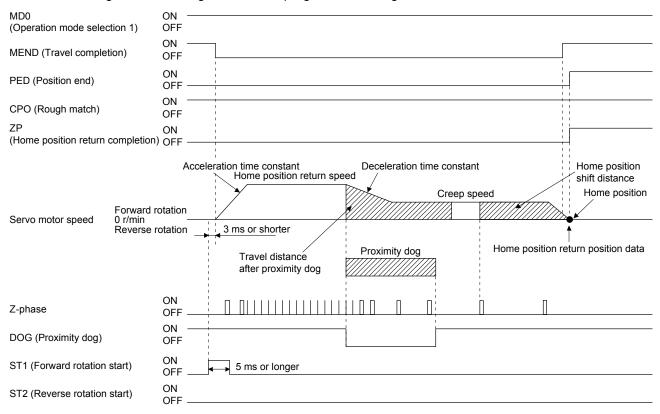

#### (1) Device/parameter

Set input devices and parameters as follows:

| Item   | Device/parameter to be used                                       | Setting  |
|--|---|--|
| Automatic operation mode of the program method     | MD0 (Operation mode selection 1)                                  | Switch on MD0.   |
| Count type home position return                    | [Pr. PT04]  | 1: Select the count type (front end detection Z-phase reference).  |
| Home position return direction                     | [Pr. PT04]  | Refer to section 5.4.1 (2) to select the home position return direction.   |
| Dog input polarity                                 | [Pr. PT29]  | Refer to section 5.4.1 (2) to select the dog input polarity.   |
| Home position return speed                         | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.  |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.  |
| Home position shift distance                       | [Pr. PT07]  | After the front end of the proximity dog is passed,<br>the position is shifted by the travel distance and<br>then is specified by the first Z-phase signal. Set<br>this to shift the position of the first Z-phase signal. |
| Travel distance after proximity dog                | [Pr. PT09]  | Set the travel distance specified after the front end of the proximity dog is passed.  |
| Acceleration time constant of home position return | [Pr. PC30]  | The acceleration time constant set for [Pr. PC30] is used.   |
| Deceleration time constant of home position return | [Pr. PC31]  | The deceleration time constant set for [Pr. PC31] is used.   |
| Home position return position data                 | [Pr. PT08]  | Set the current position when the home position return completed.  |
| Program  | DI0 (Program No. selection 1) to<br>DI3 (Program No. selection 4) | Select a program containing a "ZRT" command, which performs the home position return.  |

#### (2) Timing chart

The following shows a timing chart after a program containing a "ZRT" command is selected.

#### 5.4.4 Data set type home position return

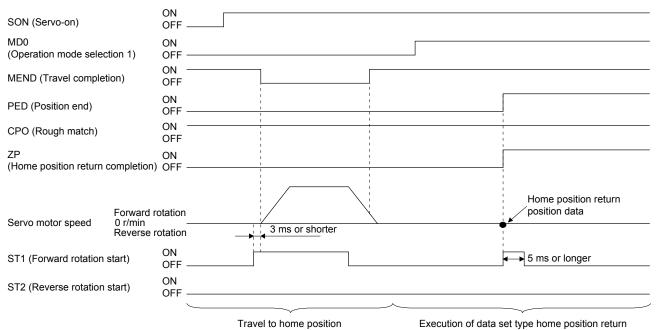

To set an arbitrary position as the home position, use the data set type home position return. The JOG operation, the manual pulse generator operation, and others can be used for the travel. The data set type home position return can be performed at servo-on only.

#### (1) Device/parameter

Set input devices and parameters as follows:

| Item   | Device/parameter to be used                                       | Setting   |
|--|---|---|
| Automatic operation mode of the program method | MD0 (Operation mode selection 1)                                  | Switch on MD0.  |
| Data set type home position return             | [Pr. PT04]  | 2: Select the data set type.  |
| Home position return position data             | [Pr. PT08]  | Set the current position when the home position return completed.                     |
| Program  | DI0 (Program No. selection 1) to<br>DI3 (Program No. selection 4) | Select a program containing a "ZRT" command, which performs the home position return. |

#### (2) Timing chart

#### 5.4.5 Stopper type home position return

For the stopper type home position return, the home position is set where the workpiece pressed against the stopper of the machine by using the JOG operation, the manual pulse generator operation, or others.

#### (1) Device/parameter

Set input devices and parameters as follows:

| Item   | Device/parameter to be used                                       | Setting  |
|--|---|--|
| Automatic operation mode of the program method       | MD0 (Operation mode selection 1)                                  | Switch on MD0.   |
| Stopper type home position return                    | [Pr. PT04]  | 3: Select the stopper type.  |
| Home position return direction                       | [Pr. PT04]  | Refer to section 5.4.1 (2) to select the home position return direction.   |
| Home position return speed                           | [Pr. PT05]  | Set the rotation speed until the workpiece is pressed against the mechanical stopper.  |
| Stopper time   | [Pr. PT10]  | Set the time from when the home position data is<br>obtained after the workpiece pressed against the<br>stopper until when ZP (Home position return<br>completion) is outputted. |
| Stopper type home position return torque limit value | [Pr. PT11]  | Set the servo motor torque limit value at the execution of the stopper type home position return.  |
| Acceleration time constant of home position return   | [Pr. PC30]  | The acceleration time constant set for [Pr. PC30] is used.   |
| Deceleration time constant of home position return   | [Pr. PC31]  | The deceleration time constant set for [Pr. PC31] is used.   |
| Home position return position data                   | [Pr. PT08]  | Set the current position when the home position return is complete.  |
| Program  | DI0 (Program No. selection 1) to<br>DI3 (Program No. selection 4) | Select a program containing a "ZRT" command, which performs the home position return.  |

#### (2) Timing chart

The following shows a timing chart after a program containing a "ZRT" command is selected.

| MD0                                    | ON          |  |                     |                                    |
|--|-------------|--|---------------------|------------------------------------|
| (Operation mode selection 1)           | OFF         |  |                     |                                    |
| MEND (Travel completion)               | ON<br>OFF   |  | [                   |                                    |
| PED (Position end)                     | ON<br>OFF   |  |                     |                                    |
| CPO (Rough match)                      | ON<br>OFF   |  | <br> <br> <br> <br> |                                    |
| ZP<br>(Home position return completion | ON<br>) OFF |  |                     |                                    |

| ST2 (Reverse rotation start)           | ON<br>OFF   |  | 1                   |                                    |
| TLC (Limiting torque)                  | ON<br>OFF   |  | ↓  <br>  ↓ ↓        | Stopper time                       |
| Torque limit value                     |             | [Pr. PC35] [Pr. PT11] (Note)                             |                     | [Pr. PC35]                         |

Note. The following torque limits are enabled.

| Input device | (0: off, 1: on) | Limit value status |   | Enabled torque limit value |          |
|--------------|-----------------|--------------------|---|----------------------------|----------|
| TL1          | TL              |                    |   |                            |          |
| 0            | 0               |                    |   | Pr. PT11                   |          |
| 0            | 1               | TLA                | > | Pr. PT11                   | Pr. PT11 |
| 0            | I               | TLA                | < | Pr. PT11                   | TLA      |
| 1            | 0               | Pr. PC35           | > | Pr. PT11                   | Pr. PT11 |
| I            | 0               | Pr. PC35           | < | Pr. PT11                   | Pr. PC35 |
| 1            | 1               | TLA                | > | Pr. PT11                   | Pr. PT11 |
|              | 1               | TLA                | < | Pr. PT11                   | TLA      |

The setting value of [Pr. PT08 Home position return position data] is used as the position address at the home position return completion.

5.4.6 Home position ignorance (servo-on position as home position)

POINT
 To perform a home position return by using the home position ignorance, selecting a program containing a "ZRT" command is not required.

The position at servo-on is used as the home position.

#### (1) Device/parameter

Set input devices and parameters as follows.

| Item                               | Device/parameter to be used | Setting   |
|------------------------------------|-----------------------------|---|
| Home position ignorance            | [Pr. PT04]                  | 4: Select the home position ignorance (servo-on position as home position). |
| Home position return position data | [Pr. PT08]                  | Set the current position when the home position return completed.           |

#### (2) Timing chart

|                         | ON r                             |                                    |

| 000 (D                  | ON                               |                                    |
| CPO (Rough match)       | OFF                              |                                    |
| ZP (Home position retur | rn completion) ON                |                                    |
|                         | OFF                              |                                    |
|                         |                                  | Home position return position data |
|                         | Forward rotation                 |                                    |
| Servo motor speed       | 0 r/min ————<br>Reverse rotation | •                                  |

5.4.7 Dog type rear end reference home position return

•This home position return method depends on the timing of reading DOG (Proximity dog) that has detected the rear end of the proximity dog. Therefore, when a home position return is performed at a creep speed of 100 r/min, the home position has an error of 200 pulses (for HG series servo motor). The higher the creep speed, the greater the error of the home position.

Deceleration starts from the front end of the proximity dog. After the rear end is passed, the position is shifted by the travel distance after proximity dog and the home position shift distance. The position after the shifts is set as the home position. The home position return is available independently of the Z-phase signal.

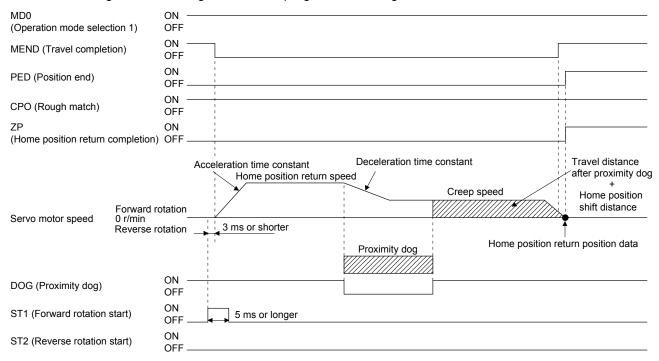

#### (1) Device/parameter

Set input devices and parameters as follows:

| Item   | Device/parameter to be used                                       | Setting  |
|--|---|--|
| Automatic operation mode of the program method     | MD0 (Operation mode selection 1)                                  | Switch on MD0.   |
| Dog type rear end reference home position return   | [Pr. PT04]  | 5: Select the dog type (rear end detection/rear end reference).  |
| Home position return direction                     | [Pr. PT04]  | Refer to section 5.4.1 (2) to select the home position return direction.                                   |
| Dog input polarity                                 | [Pr. PT29]  | Refer to section 5.4.1 (2) to select the dog input polarity.   |
| Home position return speed                         | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.  |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.  |
| Home position shift distance                       | [Pr. PT07]  | Set this to shift the home position, which is specified after the rear end of the proximity dog is passed. |
| Travel distance after proximity dog                | [Pr. PT09]  | Set the travel distance after the rear end of the proximity dog is passed.                                 |
| Acceleration time constant of home position return | [Pr. PC30]  | The acceleration time constant set for [Pr. PC30] is used.   |
| Deceleration time constant of home position return | [Pr. PC31]  | The deceleration time constant set for [Pr. PC31] is used.   |
| Home position return position data                 | [Pr. PT08]  | Set the current position when the home position return completed.  |
| Program  | DI0 (Program No. selection 1) to<br>DI3 (Program No. selection 4) | Select a program containing a "ZRT" command, which performs the home position return.                      |

#### (2) Timing chart

The following shows a timing chart after a program containing a "ZRT" command is selected.

#### 5.4.8 Count type front end reference home position return

POINT

- This home position return method depends on the timing of reading DOG (Proximity dog) that has detected the front end of the proximity dog. Therefore, when a home position return is performed at a creep speed of 100 r/min, the home position has an error of 200 pulses (for HG series servo motor). The higher the creep speed, the greater the error of the home position.
- ●After the front end of the proximity dog is detected, if a home position return ends without reaching the creep speed, [AL. 90.2] occurs. Set the travel distance after proximity dog and the home position shift distance enough for deceleration from the home position return speed to the creep speed.

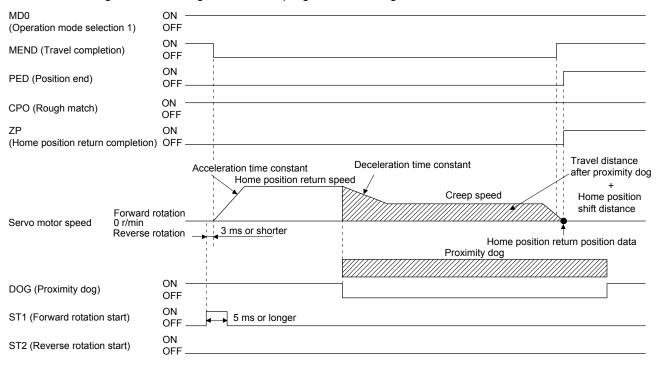

#### (1) Device/parameter

Set input devices and parameters as follows:

| Item  | Device/parameter to be used                                       | Setting  |
|---|---|--|
| Automatic operation mode of the program method            | MD0 (Operation mode selection 1)                                  | Switch on MD0.   |
| Count type front end<br>reference home position<br>return | [Pr. PT04]  | 6: Select the count type (front end detection/front end reference).  |
| Home position return direction                            | [Pr. PT04]  | Refer to section 5.4.1 (2) to select the home position return direction.                                   |
| Dog input polarity  | [Pr. PT29]  | Refer to section 5.4.1 (2) to select the dog input polarity.   |
| Home position return speed                                | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.  |
| Creep speed   | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.  |
| Home position shift distance                              | [Pr. PT07]  | Set this to shift the home position, which is specified after the rear end of the proximity dog is passed. |
| Travel distance after proximity dog                       | [Pr. PT09]  | Set the travel distance after the rear end of the proximity dog is passed.                                 |
| Acceleration time constant of home position return        | [Pr. PC30]  | The acceleration time constant set for [Pr. PC30] is used.   |
| Deceleration time constant of home position return        | [Pr. PC31]  | The deceleration time constant set for [Pr. PC31] is used.   |
| Home position return position data                        | [Pr. PT08]  | Set the current position when the home position return completed.  |
| Program   | DI0 (Program No. selection 1) to<br>DI3 (Program No. selection 4) | Select a program containing a "ZRT" command, which performs the home position return.                      |

#### (2) Timing chart

The following shows a timing chart after a program containing a "ZRT" command is selected.

#### 5.4.9 Dog cradle type home position return

A position, which is specified by the first Z-phase signal after the front end of the proximity dog is detected, is set as the home position.

#### (1) Device/parameter

Set input devices and parameters as follows:

| Item   | Device/parameter to be used                                       | Setting   |
|--|---|---|
| Automatic operation mode of the program method     | MD0 (Operation mode selection 1)                                  | Switch on MD0.  |
| Dog cradle type home<br>position return            | [Pr. PT04]  | 7: Select the dog cradle type.  |
| Home position return direction                     | [Pr. PT04]  | Refer to section 5.4.1 (2) to select the home position return direction.              |
| Dog input polarity                                 | [Pr. PT29]  | Refer to section 5.4.1 (2) to select the dog input polarity.                          |
| Home position return speed                         | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.                             |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.                             |
| Home position shift distance                       | [Pr. PT07]  | Set this to shift the home position, which is specified by the Z-phase signal.        |
| Acceleration time constant of home position return | [Pr. PC30]  | The acceleration time constant set for [Pr. PC30] is used.                            |
| Deceleration time constant of home position return | [Pr. PC31]  | The deceleration time constant set for [Pr. PC31] is used.                            |
| Home position return position data                 | [Pr. PT08]  | Set the current position when the home position return completed.                     |
| Program  | DI0 (Program No. selection 1) to<br>DI3 (Program No. selection 4) | Select a program containing a "ZRT" command, which performs the home position return. |

| (2) Timing chart                                    |               |                                     |                |                |          |                   |          |                        |

| ST2 (Reverse rotation start)                        | ON<br>OFF -   |                                     |                |                |          |                   |          |                        |

#### 5.4.10 Dog type last Z-phase reference home position return

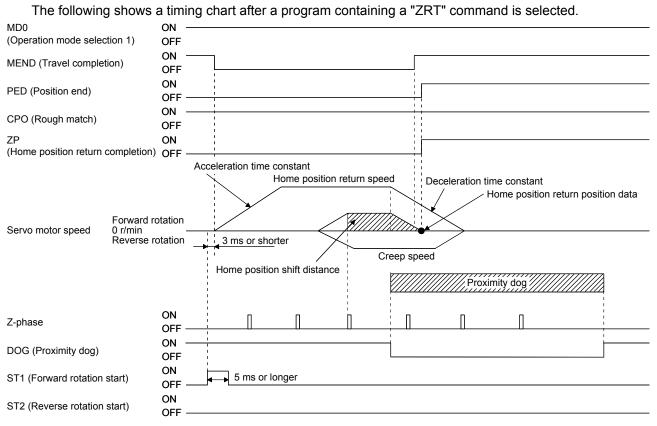

After the front end of the proximity dog is detected, the position is shifted away from the proximity dog at the creep speed in the reverse direction and then specified by the first Z-phase signal. The position of the first Z-phase signal is set as the home position.

#### (1) Device/parameter

Set input devices and parameters as follows:

| Item   | Device/parameter to be used                                       | Setting   |
|--|---|---|
| Automatic operation mode of the program method             | MD0 (Operation mode selection 1)                                  | Switch on MD0.  |
| Dog type last Z-phase<br>reference home position<br>return | [Pr. PT04]  | 8: Select the dog type (rear end detection/Z-phase reference).                        |
| Home position return direction                             | [Pr. PT04]  | Refer to section 5.4.1 (2) to select the home position return direction.              |
| Dog input polarity   | [Pr. PT29]  | Refer to section 5.4.1 (2) to select the dog input polarity.                          |
| Home position return speed                                 | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.                             |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.                             |
| Home position shift distance                               | [Pr. PT07]  | Set this to shift the home position, which is specified by the Z-phase signal.        |
| Acceleration time constant of home position return         | [Pr. PC30]  | The acceleration time constant set for [Pr. PC30] is used.                            |
| Deceleration time constant of home position return         | [Pr. PC31]  | The deceleration time constant set for [Pr. PC31] is used.                            |
| Home position return position data                         | [Pr. PT08]  | Set the current position when the home position return completed.                     |
| Program  | DI1 (Program No. selection 1) to<br>DI3 (Program No. selection 4) | Select a program containing a "ZRT" command, which performs the home position return. |

#### (2) Timing chart

5.4.11 Dog type front end reference home position return type

POINT

This home position return method depends on the timing of reading DOG (Proximity dog) that has detected the front end of the proximity dog. Therefore, when a home position return is performed at a creep speed of 100 r/min, the home position has an error of 200 pulses (for HG series servo motor). The higher the creep speed, the greater the error of the home position.

A position, which is shifted by the travel distance after proximity dog and the home position shift distance from the front end of the proximity dog, is set as the home position.

The home position return is available independently of the Z-phase signal. Changing the creep speed may change the home position.

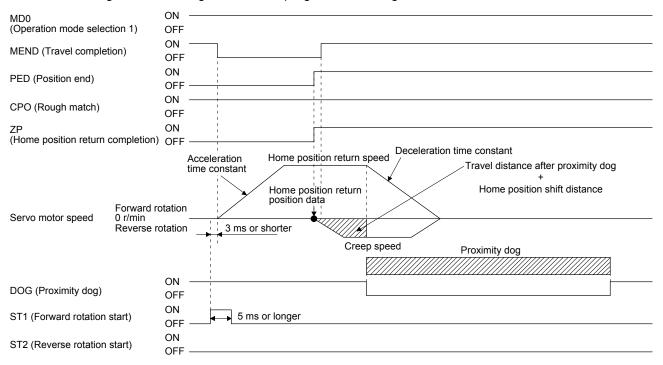

#### (1) Device/parameter

Set input devices and parameters as follows:

| Item   | Device/parameter to be used                                       | Setting   |
|--|---|---|
| Automatic operation mode of the program method       | MD0 (Operation mode selection 1)                                  | Switch on MD0.  |
| Dog type front end reference<br>home position return | [Pr. PT04]  | 9: Select the dog type (front end detection/front end reference).                     |
| Home position return direction                       | [Pr. PT04]  | Refer to section 5.4.1 (2) to select the home position return direction.              |
| Dog input polarity                                   | [Pr. PT29]  | Refer to section 5.4.1 (2) to select the dog input polarity.                          |
| Home position return speed                           | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.                             |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.                             |
| Home position shift distance                         | [Pr. PT07]  | Set this to shift the home position, which is specified by the Z-phase signal.        |
| Acceleration time constant of home position return   | [Pr. PC30]  | The acceleration time constant set for [Pr. PC30] is used.                            |
| Deceleration time constant of home position return   | [Pr. PC31]  | The deceleration time constant set for [Pr. PC31] is used.                            |
| Home position return position data                   | [Pr. PT08]  | Set the current position when the home position return completed.                     |
| Program  | DI1 (Program No. selection 1) to<br>DI3 (Program No. selection 4) | Select a program containing a "ZRT" command, which performs the home position return. |

#### (2) Timing chart

The following shows a timing chart after a program containing a "ZRT" command is selected.

#### 5.4.12 Dogless Z-phase reference home position return type

A position, which is shifted to by the home position shift distance from a position specified by the Z-phase pulse right after the start of the home position return, is set as the home position.

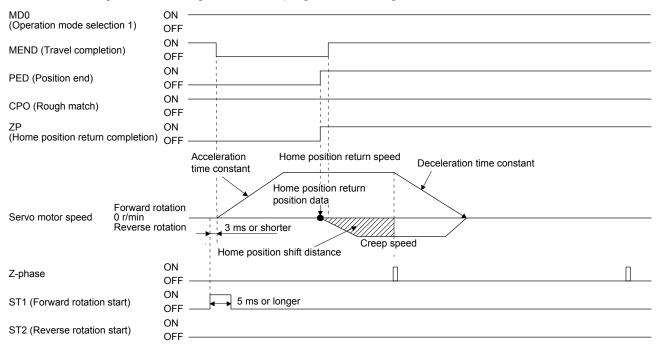

#### (1) Device/parameter

Set input devices and parameters as follows:

| Item   | Device/parameter to be used                                       | Setting   |
|--|---|---|
| Automatic operation mode of the program method     | MD0 (Operation mode selection 1)                                  | Switch on MD0.  |
| Dogless Z-phase reference<br>home position return  | [Pr. PT04]  | A: Select the dogless type (Z-phase reference).                                       |
| Home position return direction                     | [Pr. PT04]  | Refer to section 5.4.1 (2) to select the home position return direction.              |
| Dog input polarity                                 | [Pr. PT29]  | Refer to section 5.4.1 (2) to select the dog input polarity.                          |
| Home position return speed                         | [Pr. PT05]  | Set the rotation speed specified until a dog is detected.                             |
| Creep speed  | [Pr. PT06]  | Set the rotation speed specified after a dog is detected.                             |
| Home position shift distance                       | [Pr. PT07]  | Set this to shift the home position, which is specified by the Z-phase signal.        |
| Acceleration time constant of home position return | [Pr. PC30]  | The acceleration time constant set for [Pr. PC30] is used.                            |
| Deceleration time constant of home position return | [Pr. PC31]  | The deceleration time constant set for [Pr. PC31] is used.                            |
| Home position return position data                 | [Pr. PT08]  | Set the current position when the home position return completed.                     |
| Program  | DI1 (Program No. selection 1) to<br>DI3 (Program No. selection 4) | Select a program containing a "ZRT" command, which performs the home position return. |

#### (2) Timing chart

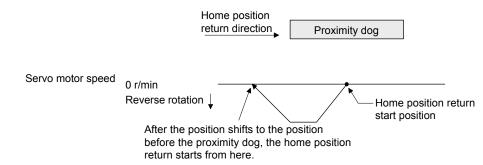

The following shows a timing chart after a program containing a "ZRT" command is selected.

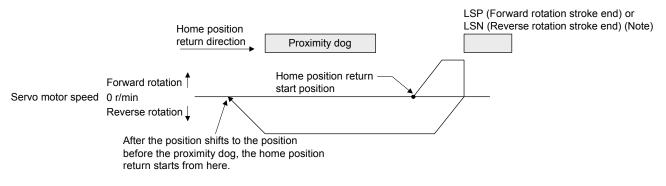

5.4.13 Automatic retract function used for the home position return

For a home position return using a proximity dog, if the home position return starts from or beyond the proximity dog, this function executes the home position return after the position is shifted back to where the home position return is possible.

(1) When the current position is on the proximity dog When the current position is on the proximity dog, the position is shifted back automatically to execute the home position return.

- (2) When the current position is beyond the proximity dog
  - The position is shifted in a direction of the home position return. When LSP (Forward rotation stroke end) or LSN (Reverse rotation stroke end) is detected, the position is shifted back automatically. The position will be shifted passing the proximity dog, and the travel will stop. The home position return will be restarted from that position. If the proximity dog is not detected, the travel stops at LSP or LSN on the opposite side, and [AL.90 Home position return incomplete warning] occurs.

Note. The software limit cannot be used instead of LSP (Forward stroke end) and LSN (Reverse stroke end).

# 5. HOW TO USE THE PROGRAM

#### 5.5 Serial communication operation

Using the RS-422 communication function, the servo amplifier can be operated from a controller such as a personal computer.

This section explains the data communication procedure. Refer to chapter 10 for details of the connection between the controller and servo amplifier and of communication data.

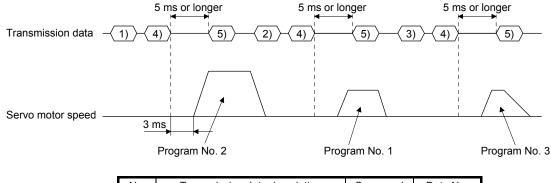

#### 5.5.1 Positioning operation using the program

The communication function enables to select program No., and positioning operation using program is possible by switching on ST1.

#### (1) Program selection

Select program No. 1 to 16 by using the forced output (command [9] [2] and data No. [6] [0]) of the device from the controller.

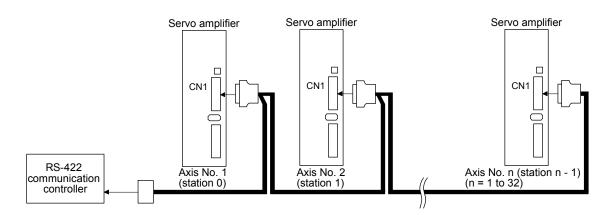

#### (2) Timing chart

| No. | Transmission data description    | Command | Data No. |
|-----|----------------------------------|---------|----------|
| 1)  | Select program No. 2.            | [9] [2] | [6] [0]  |
| 2)  | Select program No. 1.            | [9] [2] | [6] [0]  |
| 3)  | Select program No. 3.            | [9] [2] | [6] [0]  |
| 4)  | ST1 (Forward rotation start) on  | [9] [2] | [6] [0]  |
| 5)  | ST1 (Forward rotation start) off | [9] [2] | [6] [0]  |

#### 5.5.2 Multi-drop method (RS-422 communication)

The RS-422 communication function enables to operate multiple servo amplifiers on the same bus. In this method, set station Nos. to the servo amplifiers so that the controller recognizes which servo amplifier is receiving the data currently being sent. Set the station Nos. with [Pr. PC20 Station number setting]. Be sure to set one station No. to one servo amplifier. Setting one station No. to multiple servo amplifiers will disable a normal communication. When operating multiple servo amplifiers with one command, use the group specification function mentioned in section 5.5.3. For the cable connection, refer to section 12.1.1 (2) of "MR-JE-\_A Servo Amplifier Instruction Manual".

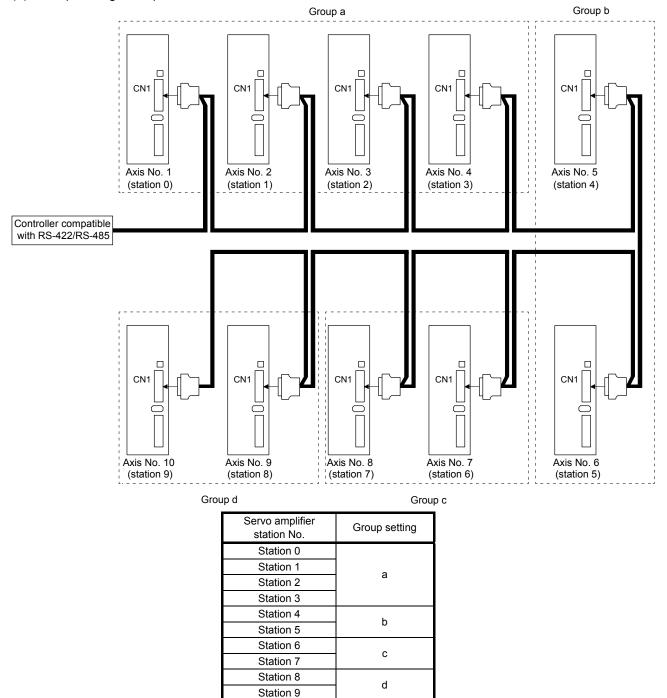

#### 5.5.3 Group specification

•Set only one servo amplifier capable of returning data in a group. If multiple servo amplifiers return data simultaneously after receiving a command from the controller, the servo amplifiers may malfunction.

When using multiple servo amplifiers, you can set parameters with commands per group. Up to six groups of a to f can be set. Set groups for each station with the communication commands of Mitsubishi general-purpose AC servo protocol.

(1) Group setting example

#### (2) Timing chart

The following shows a timing chart of operation for each group performed with setting values set in program No. 1.

|            | Transmission data                 | -(1) | (2) $(3)$ $(4)$ $(5)$   | $\left< \frac{6}{7} \right> - \left< \frac{7}{7} \right>$ |                            |                     |   |
|------------|-----------------------------------|------|-------------------------|---|----------------------------|---------------------|---|

| 12) | ST1 (Forward rotation start) off | [9] [2] | [6] [0]  |

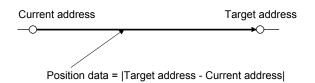

Besides this, you can perform simultaneous writing of common parameters to stations of each group, reset alarms, etc.

5.6 Incremental value command method

When using this servo amplifier in incremental value command method, change the setting of [Pr. PT01]. As position data, set the travel distance from the current address to the target address. The incremental value command method enables infinitely long constant rate of feeding.

Setting range: -999999 to 9999999 [×10<sup>STM</sup>  $\mu$ m] (STM = Feed length multiplication [Pr. PT03]) -999999 to 9999999 [×10<sup>(STM-4)</sup> inch] (STM = Feed length multiplication [Pr. PT03])

-999999 to 999999 [pulse]

This section indicates contents different from the absolute value command method (factory setting) when this servo amplifier is used under the incremental value command method.

#### (1) Parameter setting

Set [Pr. PT01] to select the incremental value command method as shown below.

- Incremental value command method

#### (2) Command

The command contents of "MOV" and "MOVA" are changed as follows. There is no change in other commands. Thus, the command contents are the same between "MOV" and "MOVI", and between "MOVA" and "MOVIA".

| Command | Name  | Setting                 | Setting<br>range     | Unit                 | Indirect specification | Description  |
|---------|---|-------------------------|----------------------|----------------------|------------------------|--|
| MOV     | Incremental value travel command                        | MOV<br>(setting value)  | -999999 to<br>999999 | ×10 <sup>s™</sup> µm | 0                      | The servo motor rotates using the set value as the incremental value.<br>The same as "MOVI" command  |
| MOVA    | Incremental<br>value<br>continuous<br>travel<br>command | MOVA<br>(setting value) | -999999 to<br>999999 | ×10 <sup>s™</sup> µm | 0                      | The servo motor rotates continuously as the set<br>incremental value.<br>Make sure to describe this command after the<br>"MOV" command. If this command is described<br>after other command, an error will occur.<br>The same as "MOVIA" command |

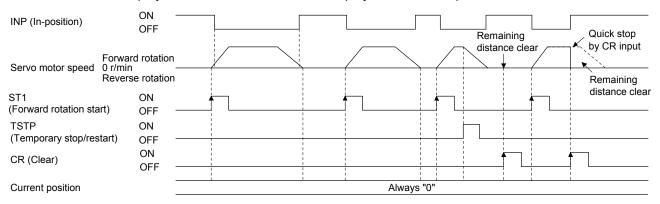

#### (3) Program example

| Command   |  | Description                               |
|---|--|---|

#### 5.7 Roll feed mode using the roll feed display function

Refer to section 4.5 for parameter settings of roll feed display function, position data unit and operation method.

When the roll feed display function is used, the status display of the current position at start will be 0.

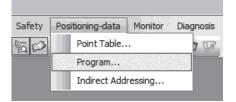

#### 5.8 Program setting method

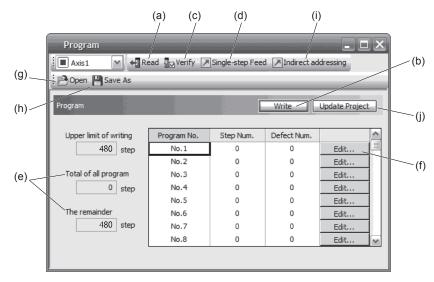

The following shows the setting method of programs using MR Configurator2.

#### 5.8.1 Setting procedure

Click "Positioning-data" in the menu bar and "Program" in the menu.

The following window will be displayed.

(1) Reading program (a)

Click the "Read" button to read and display programs from the servo amplifier.

- (2) Writing program (b)Click the "Write" button to write the changed programs to the servo amplifier.
- (3) Verifying program (c)

Click the "Verify" button to verify the contents of programs in the personal computer and the servo amplifier.

- (4) Single-step feed (d)
   Click "Single-step Feed" to perform the single-step feed test operation. Refer to section 3.1.9 for details.
- (5) Number of steps (e)The numbers of steps used in all programs and the remained steps are displayed.

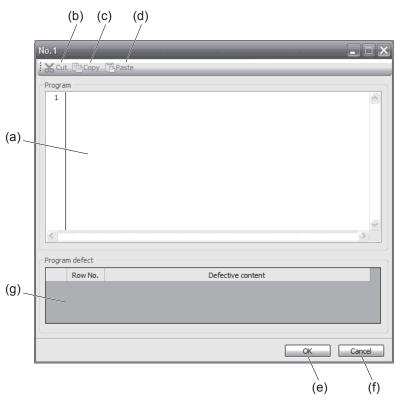

# (6) Editing program (f)

Selected programs can be edited. Click the "Edit" button to open the program editing window. For the editing window, refer to section 5.8.2.

# 5. HOW TO USE THE PROGRAM

- (7) Reading program file (g) Click "Open" to read the program table data.
- (8) Saving program file (h)Click "Save As" to save the program table data.
- (9) Indirect addressing (i)
   Click "Indirect addressing" to open the indirect addressing window. Refer to section 5.8.3 for details.
- (10) Updating project (j)Click "Update Project" to update the program to a project.
- 5.8.2 Window for program edit

Programs can be created on the program editing window.

#### (1) Program edit (a)

Input commands to the program edit area (a) in text format.

#### (2) Cutting text (b)

Select any text in the program edit area, and click the "Cut" button to cut the selected text.

(3) Copying text (c)

Select any text in the program edit area, and click the "Copy" button to copy the selected text to the clipboard.

(4) Pasting text (d)

Click the "Paste" button to paste the copied text on the clipboard to a specified place in the program edit area.

- (5) Ending program data window (e) Click the "OK" button to execute the edit check. When no error is found in the program, the edit ends and the program data window will be closed. If an error is found in the program after the edit check, the error will be displayed.
- (6) Canceling window for program edit (f) Click the "Cancel" button to close the window for program edit without saving the program currently being edited.
- (7) Displaying error (g)

When the edit check of (5) detects an error in the program, the line No. and content of the error will be displayed. Click the error content, the cursor will move to the line of the corresponding program.

5.8.3 Indirect addressing window

Set general purpose registers (D1 to D4 and R1 to R4) in this window.

|     | Indirect addressing                                    |      |  |  |  |  |
|-----|--|------|--|--|--|--|
|     | Axis1 Program  |      |  |  |  |  |
|     | Units in position specification: 0.001 mm              |      |  |  |  |  |
| (b) | Range in position specification: (-999.999-999.999) mm | _(a) |  |  |  |  |
|     | D1 100 Set value of D1                                 | - () |  |  |  |  |
|     | D2 200 Set value of D2                                 |      |  |  |  |  |
|     | D3 0 Set value of D3                                   |      |  |  |  |  |
|     | D4 0 Set value of D4                                   |      |  |  |  |  |
|     | RI 1000 Set value of R1                                | (C)  |  |  |  |  |
|     | R2 0 Set value of R2                                   |      |  |  |  |  |
|     | R3 0 Set value of R3                                   |      |  |  |  |  |
|     | R4 0 Set value of R4                                   |      |  |  |  |  |

(1) Register edit field (a)

Set general purpose register values of D1 to D4 and R1 to R4.

(2) Register reference field (b)

The last register value read from the servo amplifier is displayed.

(3) ROM writing button (c)

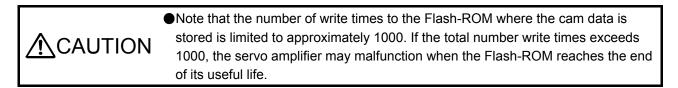

Write register values (D1 to D4 and R1 to R4) stored in the servo amplifier to the servo amplifier.

## 6. APPLICATION OF FUNCTIONS

This chapter explains about application of using positioning function of servo amplifier.

#### 6.1 Simple cam function

 POINT

 ●The simple cam function is available with servo amplifiers with software version B7 or later.

6.1.1 Outline of simple cam function

Simple cam function enables synchronous control by using software instead of controlling mechanically with cam.

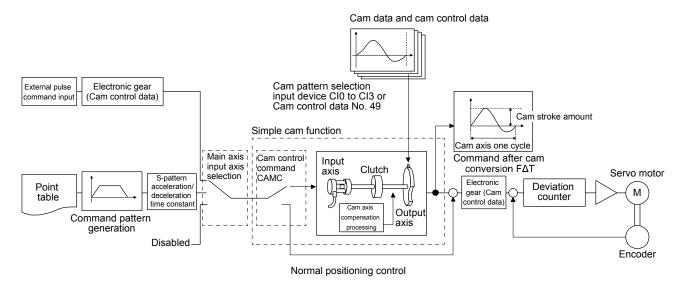

The following shows a movement trajectory when the cam below is used and the input axis is rotated once.

By setting cam data and cam control data, the simple cam function enables synchronous control with an input axis (external pulse command input, point table command, or program positioning command) with a start of positioning.

#### 6.1.2 Simple cam function block

The function block diagram of the simple cam is shown below. Set the cam data with MR Configurator2.

6 - 2

### 6.1.3 Control of simple cam function

The following three cam controls are available by setting the cam data and the cam control data with MR Configurator2.

| Cam control method    | Description  | Actual movement  |
|-----------------------|--|--|
| To-and-fro<br>control | Reciprocates<br>within a<br>specified cam<br>stroke.                   | Cam data and<br>cam control data<br>Cam axis<br>one cycle<br>current value<br>(Input)<br>Cam conversion<br>processing<br>Feed current<br>value (Output)  |
| Feed<br>control       | Updates a<br>cam standard<br>position per<br>cycle.                    | Cam data and<br>cam control data<br>Cam axis<br>one cycle<br>current value<br>(Input)<br>Cam conversion<br>processing<br>(Cam created by users)<br>Feed current<br>value (Output)<br>Cam standard<br>Feed current<br>value (Output)<br>Cam standard<br>Cam standard<br>C |
| Linear<br>control     | Performs<br>linear control<br>to keep one-<br>cycle ratio as<br>100 %. | Cam data and<br>cam control data<br>Cam axis<br>one cycle<br>current value<br>(Input)<br>Cam conversion<br>processing<br>(Linear cam: Cam No. 0)<br>Feed current<br>value (Output)<br>Feed current<br>value (Output)<br>Stroke amount × 100 %  |

The feed current value of the cam axis is calculted as follows:

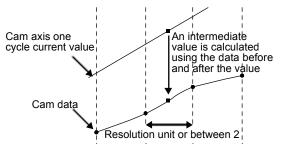

#### (1) Stroke ratio data type

Feed current value = Cam standard position + (Cam stroke amount × Stroke ratio to cam axis one cycle current value)

#### (2) Coodinate data type

Feed current value = Cam standard position + Output value to cam axis one cycle current value

When the cam axis one cycle current value is in the middle of the specified stroke ratio data, the intermediate value is calculated from the anteroposterior cam data.

#### 6.1.4 Simple cam specification list

#### (1) Specification list

| Item                     |                      | tem                       | MR-JEA  |
|--------------------------|----------------------|---------------------------|---|
| Memory capacity (Note 1) |                      | Storage area for cam data | 8 Kbytes (Flash-ROM)  |
|                          |                      | Working area for cam data | 8 Kbytes (RAM) (Note 2)   |
| Number of registration   |                      |                           | Max. 8  |
| Comment                  |                      |                           | Max. 32 single-byte characters for each cam data  |
|                          | Stroke ratio data    | Cam resolution            | 256/512/1024/2048   |
|                          | type                 | Stroke ratio              | -100.000 to 100.000 [%]   |
| Cam data                 | Coordinata data      | Number of coordinate      | 2 to 1024   |
|                          | Coordinate data type | Coordinate data           | Input value: 0 to 999999  |
|                          |                      |                           | Output value: -999999 to 999999   |
| Cam curve                |                      |                           | 12 types (constant speed/constant acceleration/5th<br>curve/single hypotenuse/cycloid/distorted<br>trapezoid/distorted sine/distorted constant<br>speed/trapecloid/reverse trapecloid/double<br>hypotenuse/reverse double hypotenuse) |

Note 1. The memory capacity includes a use area (storage area for cam data) for storing in the servo amplifier and an actual operation area (working area for cam data).

2. This can be always changed by using Modbus-RTU communication during servo-off.

#### (2) Cam resolution

#### (a) Stroke ratio data type

| Cam resolution | Max. number of registration |
|----------------|-----------------------------|
| 256            | 8                           |
| 512            | 4                           |
| 1024           | 2                           |
| 2048           | 1                           |

#### (b) Coordinate data type

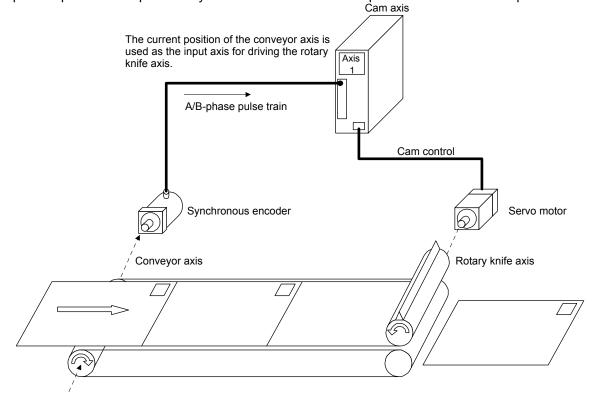

| Number of coordinate | Max. number of registration |
|----------------------|-----------------------------|
| 128                  | 8                           |
| 256                  | 4                           |
| 512                  | 2                           |
| 1024                 | 1                           |

6.1.5 What is able to do with the simple cam

#### (1) Encoder following function

The servo amplifier receives A/B-phase output signal from a synchronous encoder and drives the servo motor with the signal.

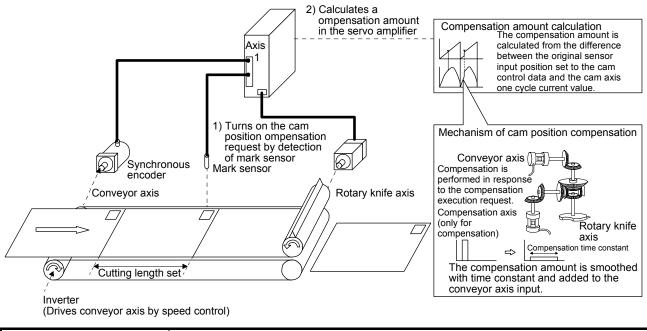

Up to 4 Mpulses/s of input from sysnchronous encoder is compatible with the servo amplifier.

Inverter (Drives conveyor axis by speed control)

(2) Mark sensor input compensation function

The servo amplifier receives input signals from a mark sensor, calculates compensation amounts, and corrects position errors of the rotary knife axis.

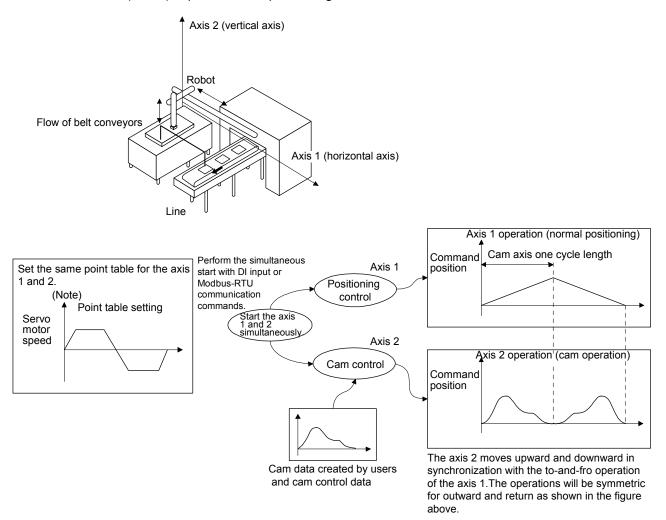

| Item                                       | Specifications                                     |  |
|--|--|--|
| Number of mark detection setting           | One setting (one input)                            |  |
| Input signal detection direction           | Detected by rising edge of an external input sigal |  |
| Detection accuracy<br>(compensation cycle) | Max. 888 µs  |  |

### 6. APPLICATION OF FUNCTIONS

(3) Synchronous operation using positioning data

A synchronous operation is enabled by setting the same positioning data and starting the positioning simultaneously.

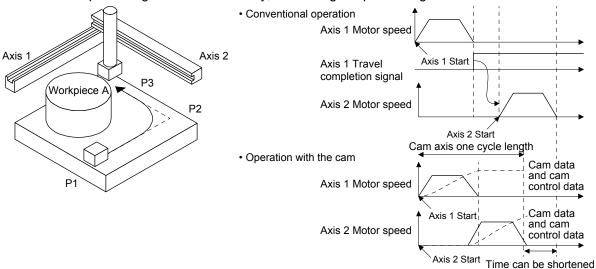

For example, to synchronize the vertical motion of the vertical axis (axis 2) with the position of the horizontal axis (axis 1), input the same positioning commands to axis 2 as those for axis 1.

Note. Input the same positioning commands to the driven shaft (axis 2) as those for the main shaft (axis 1).

(4) Operation example of synchronous interpolation between two axes

To move a part from point P1 to P3 making a detour to avoid work A, axis 2 starts moving after the travel completion signal of axis 1 is checked at point P2. However, by using the cam control, checking of the travel completion signal is not necessary, shortening the positioning time.

(5) Cam data transmission through Modbus-RTU

Rewriting cam data is possible by transmitting the cam data through Modbus-RTU communication if over eight cam data exceeding the maximum number of registration need to be used. In this case, be sure to rewrite the cam data in servo-off state.

#### 6.1.6 Setting list

(1) List of items set with MR Configurator2

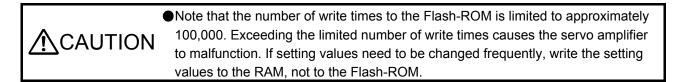

Set the following on the cam setting window of MR Configurator2.

| Setting item     |                                 | Setting  |  |
|------------------|---------------------------------|--|--|
|                  | Main shaft input axis selection | Select a command input method for cam axis.<br>Select from "encoder following (external pulse input) and "internal point table".             |  |
|                  | Cam No. selection               | Select the number to create the cam control data.  |  |
| Cam control data | Resolution setting              | Set the cam resolution. Select from 256/512/1024/2048.   |  |
|                  | Cam axis one cycle<br>length    | Set a travel amount of cam one cycle. Command unit is used as an input unit.   |  |
|                  | Cam stroke amount               | Set a cam stroke amount for the stroke ratio of 100% when using the stroke ratio data type cam control.                                      |  |
| Cam data         |                                 | Create the cam data on the cam creating window of MR Configurator2.<br>After the data is created, write the cam data to the servo amplifier. |  |

(2) List of items set with parameters of the servo amplifier Set the following with the parameters of the servo amplifier.

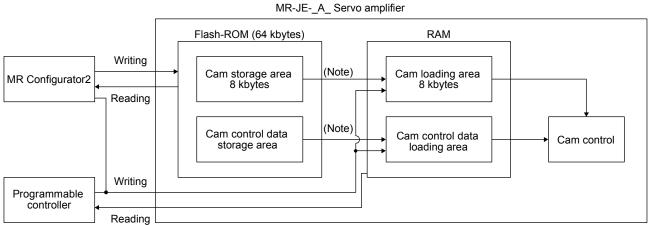

| Setting item             | Setting  |  |  |  |
|--------------------------|--|--|--|--|
| Operation mode selection | Select "Positioning mode (point table method or program method)" with [Pr. PA01 Operation mode].   |  |  |  |
| Cam function setting     | Enable the cam function with [Pr. PT35 Function selection T-5]   |  |  |  |
| Cam data selection       | Select the cam data to be executed with CI0 (Cam No. selection 0) to CI3 (Cam No. selection 3).<br>Selecting the cam data for execution is also possible with "Cam control data No. 49 Cam No.". |  |  |  |
| Device setting           | Assign CAMC (Cam control command input) and CAMS (Output in cam control) with I/O setting parameters ([Pr. PD_ ]).   |  |  |  |

#### 6.1.7 Data to be used with simple cam function

(1) Memory configuration of cam control data and cam data

The cam control data and the cam data used for the simple cam are stored in Flash-ROM inside the servo amplifier. When the power is turned on, the cam data and the cam control data are copied from the Flash-ROM to the RAM inside the servo amplifier, and then cam control will be executed.

Note. When the power is turned on, the cam data and the cam control data are copied from the Flash-ROM to the RAM inside the servo

amplifier, and then cam control will be executed.

Use MR Configurator2 to write the cam data and the cam control data. Two writing methods are available.

| Writing method    | Description  |  |  |
|-------------------|--|--|--|
| Temporary writing | Write the cam control data and the cam data to the RAM of the servo amplifier. After writing, the cam control data and the cam data will be reflected.   |  |  |
|                   | The written data will be disabled if the power is turned off.<br>Use this when creating and adjusting the cam control data and the cam data.   |  |  |
| Writing           | Write the cam control data and the cam data to the Flash-ROM. The data will be enabled when the power is cycled after writing<br>After cycling the power, control is performed based on the written data.<br>Conduct this after the cam control data and the cam data are finalized. |  |  |

#### (2) Cam control data and cam data

The following two types are available for the cam control data and cam data.

| Cam data type          | Description  |  |
|------------------------|--|--|
| Stroke ratio data type | Cam curve of one cycle is divided equally by the number of cam resolution and defined.   |  |
|                        | The cam curve will be created with the stroke ratio data of the number of cam resolution.  |  |
| Coordinate data type   | Data in which cam curve of one cycle is defined with two or more points. The coordinate data is defined as (input value and output value). The input value will be the cam axis one cycle current value, and the output value will be the stroke value from the cam standard position. |  |

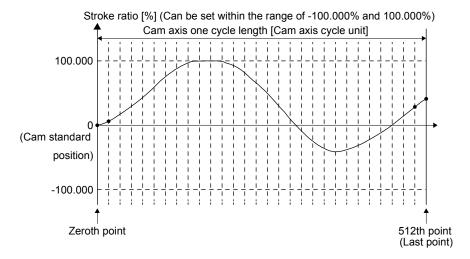

#### (a) Stroke ratio data type

The following are set in the stroke ratio data type.

Set these on the cam setting window of MR Configurator2.

| Setting item                                 | Setting   | Setting range                  |
|--|---|--------------------------------|
| Cam No.                                      | Set a Cam No.   | 0: Linear cam                  |
|  |   | 1 to 8: User-created cam       |
| Cam control data and cam data type           | Set "1: Stroke ratio data type".  |                                |
| Cam resolution                               | Set the number of divisions for the cam curve of one cycle.   | Select from 256/512/1024/2048. |
| Cam control data and dam data start position | Set the position of the cam control data and the cam data when "cam axis one cycle current value" is "0". | 0 to "Cam resolution - 1"      |
| Stroke ratio data                            | Set the stroke ratio from the first to the last point.  | -100.000 to 100.000            |

The following is a setting example for "cam resolution = 512" in the stroke ratio data type.

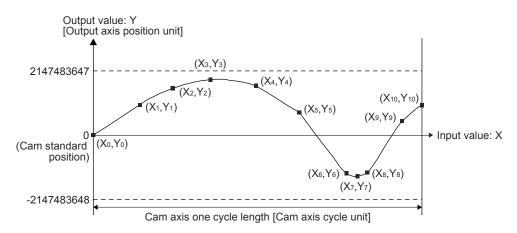

(b) Coordinate data type

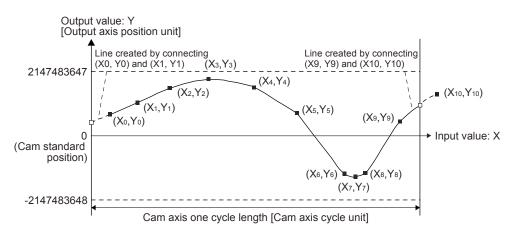

The following are set in the coordinate data type. Set these on the cam setting window of MR Configurator2.

| Setting item                                 | Setting   | Setting range                             |
|--|---|---|
| Cam No.                                      | Set a Cam No.   | 0: Linear cam<br>1 to 8: User-created cam |
| Cam control data and cam data type           | Set "2: Coordinate data type".  |   |
| Number of coordinate                         | Set the number of coordinates for the cam curve of one cycle.<br>The number of coordinates includes 0th point.  | 2 to 1024                                 |
| Cam control data and dam data start position | Setting is not necessary.   |   |
| Coordinate data                              | Set the coordinate data (input value Xn and output value Yn) for the number of coordinates.<br>Set from the 0th coordinate data (X0 and Y0).<br>Set an input value larger than that of the coordinate data. | -999.999 to 999.999                       |

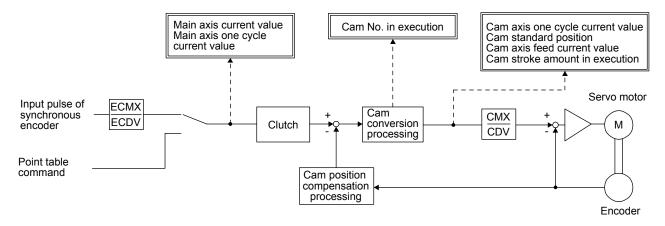

#### The following is a setting example for the coordinate data type.

If "input value = 0" and "input value = cam axis one cycle length" are not set in the coordinate data, a control is executed by the line created from the closest two points.

#### 6.1.8 Function block diagram for displaying state of simple cam control

#### 6.1.9 Operation

For operation method, contact your local sales office.

#### 6.2 Mark detection

6.2.1 Current position latch function

#### POINT

- The current position latch function can be used with the point table method and the program method. However, the current position latch function is disabled in the folloing condition.
  - Home position return
  - Manual operation (excluding home position return)
- The latched actual current position data can be read with communication commands.
- •For the servo amplifiers with software version B6 or earlier, the latched position data is not compatible with the current position of the state monitor when the roll feed display function is enabled. Disable the roll feed display function to compare the current data of the state monitor and the latched position data.
- •For the servo amplifiers with software version B7 or later, the read latched position data is equal to the travel distance as the starting point is set to "0" when the roll reed display function is enabled. The output value is the same as the current position of the state monitor.

When the mark detection signal turns on, the current position is latched. The latched data can be read with communication commands.

#### (1) Communication command

Reads mark detection data.

|         |          | Description  |   | Control mode |                 | Frama           |
|---------|----------|--|---|--------------|-----------------|-----------------|
| Command | Data No. |  |   | C            | P<br>S          | Frame<br>length |
| [1] [A] | [0] [0]  | MSD (Mark detection) rising latch data (data part)                           | 0 | $\circ$      | $\overline{\ }$ | 8               |
|         | [0] [1]  | MSD (Mark detection) falling latch data (data part)                          | 0 | $\circ$      |                 |                 |
|         | [0] [2]  | MSD (Mark detection) rising latch data (data part + additional information)  |   | $\circ$      | $\overline{\ }$ | 12              |
|         | [0] [3]  | MSD (Mark detection) falling latch data (data part + additional information) |   | $\circ$      |                 |                 |

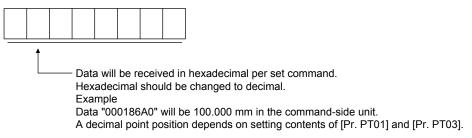

#### (2) Reading data

- (a) Rising latch data or falling latch data (data part)
   Reads MSD (Mark detection) rising latch data or MSD (Mark detection) falling latch data.
  - 1) Transmission

Transmit command [1] [A] and data No. [0] [0] or [0] [1] corresponding to the point tables to read. Refer to section 10.1.1.

2) Return

The slave station returns the position data of point table requested.

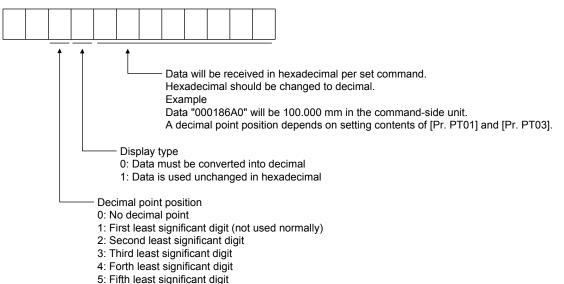

(b) Rising latch data or falling latch data (data part + additional information) Reads MSD (Mark detection) rising latch data or MSD (Mark detection) falling latch data.

#### 1) Transmission

Transmit command [1] [A] and data No. [0] [2] or [0] [3] corresponding to the point tables to read. Refer to section 10.1.1.

2) Return

The slave station returns the speed data of point table requested.

### (3) Parameter

Set the parameter as follows:

| Item   | Parameter to be used | Setting   |
|--|----------------------|---|
| Mark detection function selection              | [Pr. PT26]           | Set the mark detection function selection as follows:<br>0: Current position latch function   |
| Mark detection range + (lower three digits)    | [Pr. PC66]           | Set the upper limit of the latch data in the current position<br>latch function. When the roll feed display is enabled, set a<br>valid range with the travel distance from the starting position.<br>Set a same sign for [Pr. PC66] and [Pr. PC67]. A different<br>sign will be recognized as minus sign data.  |
| Mark detection range +<br>(upper three digits) | [Pr. PC67]           | When changing the direction to address decreasing, change it<br>from the - side of the mark detection ([Pr. PC68] and [Pr.<br>PC69]). An incorrect order of the setting will trigger [AL. 37].<br>Therefore, cycling power may be required after [Pr. PC66] to<br>[Pr. PC69] are all set.<br>This parameter is supported with software version B7 or later. |
| Mark detection range - (lower<br>three digits) | [Pr. PC68]           | Set the lower limit of the latch data in the current position latch function. When the roll feed display is enabled, set a valid range with the travel distance from the starting position. Set a same sign for [Pr. PC68] and [Pr. PC69]. A different sign will be recognized as minus sign data.  |
| Mark detection range - (upper<br>three digits) | [Pr. PC69]           | When changing the direction to address increasing, change it<br>from the + side of the mark detection ([Pr. PC66] and [Pr.<br>PC67]). An incorrect order of the setting will trigger [AL. 37].<br>Therefore, cycling power may be required after [Pr. PC66] to<br>[Pr. PC69] are all set.<br>This parameter is supported with software version B7 or later. |

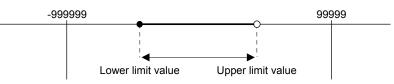

#### (4) Latch data range setting

The current position is latched only within the range set in [Pr. PC66] to [Pr. PC69] When a same value is set for the upper and lower limits, the current value will be latched for a whole range.

(a) mm, inch, and pulse unit

The current position latch function is enabled when Upper limit value > Lower limit value. The valid range is the same for the absolute value command method ([Pr. PT01]:  $\_$  \_ 0) and the incremental value command method ([Pr. PT01]:  $\_$  \_ 1).

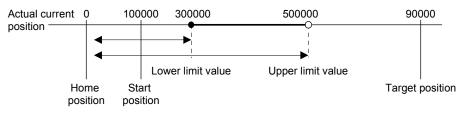

[AL. 37 occurs] when Upper limit value < Lower limit value.

1) When the roll feed display is disabled ([Pr. PT26]: \_ 0 \_)

Set the valid range with the distance from the home position.

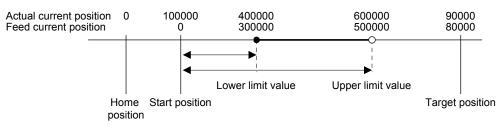

When the starting position is at 100000, [Pr. PC66] and [Pr. PC67] are set to 500000, and [Pr. PC68] and [Pr. PC69] are set to 300000, the valid range is between the actual current position of 300000 and 500000 as set in the parameters.

2) When the roll feed display is enabled ([Pr. PT26]: \_ 1 \_)

When the roll feed display is enabled, the valid range is calculated as the starting position is 0. Set the valid range with the travel distance from the starting position.

When the starting position is at 100000, [Pr. PC66] and [Pr. PC67] are set to 500000, and [Pr. PC68] and [Pr. PC69] are set to 300000, the valid range is between the feed current position of 300000 and 500000 from the start position (between the actual current position of 400000 and 600000).

#### (b) Degree unit

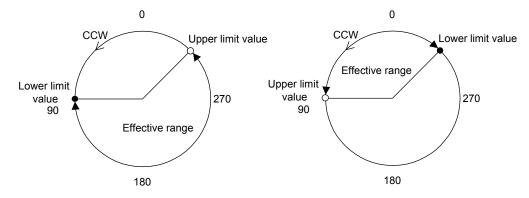

When the unit is set to "degree", the setting range of the current position latch is from 0 degree (upper limit) to 359.999 degrees (lower limit).

When you set a value other than 0 degree to 359.999 degrees in the currenct position latch +/- [Pr. PC66] to [Pr. PC69], the set value is converted as follows.

| Current position latch range         | After conversion            |
|--------------------------------------|-----------------------------|
| 360.000 degrees to 999.999 degrees   | (Setting value) % 360       |
| -0.001 degrees to -359.999 degrees   | 360 + (setting value)       |
| -360.000 degrees to -999.999 degrees | (setting value) % 360 + 360 |

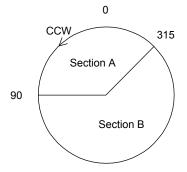

The valid range of the current position latch varies depending on the setting of the upper and lower limits.

The valid range remains unchanged even if the rotation direction is reversed.

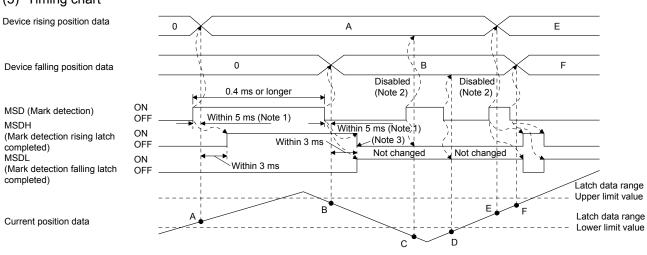

Upper limit value > Lower limit value Lower limit value > Upper limit value

To enable the current position latch function of section A in the figure, set the parameters as follows: Current position latch range -: 315.000 [degrees] ([Pr. PC68]: 0, [Pr. PC69]: 315) Current position latch range +: 90.000 [degrees] ([Pr. PC66]: 0, [Pr. PC67]: 90) To enable the current position latch function of section B in the figure, set the parameter as follows: Current position latch range -: 90.000 [degrees] ([Pr. PC68]: 0, [Pr. PC69]: 90) Current position latch range +: 315.000 [degrees] ([Pr. PC66]: 0, [Pr. PC67]: 315)

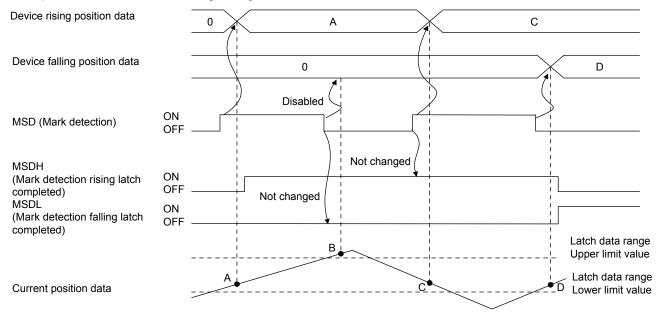

# 6. APPLICATION OF FUNCTIONS

#### (5) Timing chart

- Note 1. When MSD (Mark detection) is assigned to the CN1-10 pin with [Pr. PD44], a current position data can be obtained in high speed (within 0.4 ms). When assigning MSD (Mark detection) to the CN1-10 pin, set "Mark detection fast input signal filter selection" in [Pr. PD31].
  - 2. The position data will not be changed from the previous value.
  - 3. MSDH (Latch completed at rising edge of mark detection) turns off at the same time as MSDL (Latch completed at falling edge of mark detection) turns on. Set as MSDL turns on/off within the range of the latch data.

If MSD (Mard detection) was turned on again when the previous falling was out of the valid range, MSDH (Latch completed at rising edge of mark detection) will not change, but the position data will be updated. Refer to the following timing chart.

#### 6.2.2 Interrupt positioning function

The interrupt positioning function executes an operation by changing the remaining distance to the travel distance that is set with [Pr. PT31] (Mark sensor stop travel distance) when MSD (Mark detection) is turned on. The interrupt positioning function is enabled by setting [Pr. PT26] to "1 \_ \_ \_".

The interrupt positioning function is available with servo amplifiers with software version B7 or later.

The interrupt positioning function can be used with the point table method and the program method. However, the interrupt positioning function is disabled in the following condition.

- During home position return
- During manual operation
- During stop
- During deceleration or stop with TSTP (Temporary stop/restart)
- An error may occur depending on the droop pulses at the time of MSD (Mark detection) is turned on and a minimum stopping distance required for deceleration.

#### (1) Parameters

Set the parameters as follows:

| Item   | Parameter to be used | Setting  |
|--|----------------------|--|
| Control mode selection   | [Pr. PA01]           | Select a control mode.<br>6 (Positioning mode (point table method))<br>7 (Positioning mode (program method))   |
| Mark detection function selection  | [Pr. PT26]           | Set the mark detection function selection as follows:<br>1: Interrupt positioning function<br>Starts the interrupt positioning function at rising of MSD (Mark<br>detection).  |
| PI1 (Program input 1) Polarity<br>selection to PI3 (Program input 3)<br>Polarity selection | [Pr. PT29]           | <ul> <li>The polarity of MSD (Mark detection) can be changed with [Pr. PT29].</li> <li>Starts the interrupt positioning function at rising of MSD (Mark detection) if "x_" bit 3 of [Pr. PT29] is off.</li> <li>Starts the interrupt positioning function at falling of MSD (Mark detection) if "x_" bit 3 of [Pr. PT29] is on.</li> </ul> |
| Mark sensor stop travel distance<br>(lower three digits)                                   | [Pr. PT30]           | Set the lower three digits of the travel distance after the mark detection.<br>The travel distance starts from the current position regardless of the setting of absolute value command method or incremental value command method.  |
| Mark sensor stop travel distance<br>(upper three digits)                                   | [Pr. PT31]           | Set the upper three digits of the travel distance after the mark detection.<br>The travel distance starts from the current position regardless of the setting of absolute value command method or incremental value command method.  |
| Mark detection range + (lower three digits)  | [Pr. PC66]           |  |
| Mark detection range + (upper three digits)  | [Pr. PC67]           | Set the upper and lower limits of the interrupt positioning function. If a sign for the upper and lower differ, [AL. 37]   |
| Mark detection range - (lower three digits)  | [Pr. PC68]           | occurs. When the roll feed display is enabled, set a valid range with the travel distance from the starting position.  |
| Mark detection range - (upper three digits)  | [Pr. PC69]           |  |

#### (2) Rotation direction

|                    | Servo motor rotation direction    |
|--------------------|-----------------------------------|
| [Pr. PA14] setting |                                   |
|                    | ST1 (Forward rotation start) on   |
| 0                  | CCW rotation with + position data |
| 0                  | CW rotation with - position data  |
| 1                  | CW rotation with + position data  |
| <sup>I</sup>       | CCW rotation with - position data |

#### (3) Operation

Travels for the interrupt positioning travel distance ([Pr. PT30] and [Pr. PT31]) starting from the position where MSD (Mard detection) is turned on. The operation after a stop complies with the operation mode and the operation pattern.

#### (4) Timing chart

| MD0<br>(Operation mode<br>selection 1) | ON OFF Interrupt positioning travel distance /  |
|--|---|
| Servo motor<br>speed                   | Forward rotation<br>0 r/min<br>Reverse rotation |
| MSD (Mark dete                         | ction) ON OFF                                   |
| ST1<br>(Forward rotatior               | ON  |

Note. Deceleration time constant of the point table at the time of start is applied for the point table method, and deceleration time constant set by the program in execution is applied for the program method.

The movement other than above is as follows:

(a) The interrupt positioning travel distance is smaller than the travel distance required for the deceleration, the actual deceleration time constant will be shorter than the set time constant.

| MD0<br>(Operation mode<br>selection 1) | ON<br>OFF                                 | Interrupt positioning tr | avel distance |   |
|--|---|--------------------------|---------------|---|
| Servo motor<br>speed                   | Forward rotat<br>0 r/min<br>Reverse rotat |                          | → - 0.888 ms  | Recalculated deceleration time constant |
| MSD (Mark detec                        | tion) ON<br>OFF                           |                          |               |   |
| ST1<br>(Forward rotation               | ON<br>start) OFF                          |                          |               |   |

(b) If the interrupt travel distance is large during acceleration, the servo motor stops with the deceleration time constant after rotating with the command speed at which MSD (Mark detection) turned on.

| MD0<br>(Operation mode<br>selection 1) | ON<br>OFF                | Interrupt positioning travel distance ([Pr. PT30] and [Pr. PT31]) |
|--|--------------------------|---|
|  |                          | Deceleration time constant (Note)                                 |
|  |                          |   |
| Servo motor<br>speed                   | Forward rotat<br>0 r/min | on / //////////////////////////////////                           |
| speed                                  | Reverse rotat            | ion 0.888 ms  |
| MSD (Mark dete                         | ction) ON<br>OFF         |   |
| ST1<br>(Forward rotatior               | ON<br>start) OFF         |   |

Note. Deceleration time constant of the point table at the time of start is applied for the point table method, and deceleration time constant set by the program in execution is applied for the program method.

(c) If the interrupt travel distance is large during deceleration, the servo motor stops with the deceleration time constant after rotating with the command speed at which MSD (Mark detection) turned on.

| MD0<br>(Operation mode<br>selection 1) | ON OFF           |                                       |
|--|------------------|---------------------------------------|
| ,                                      |                  | Speed when MSD is on                  |
|  |                  | / Deceleration time                   |
|  |                  | constant (Note)                       |
| Servo motor                            | Forward rotation |                                       |
| speed                                  | Reverse rotation | 0.888 ms                              |
| MSD (Mark dete                         | ction) OFF       | Interrupt positioning travel          |
| ST1                                    | ON               |                                       |
| (Forward rotation                      | n start) OFF 🖳 🗠 | · · · · · · · · · · · · · · · · · · · |

- Note. Deceleration time constant of the point table at the time of start is applied for the point table method, and deceleration time constant set by the program in execution is applied for the program method.
- (d) Input will be disabled if MSD (Mark detection) is turned on again during the interrupt positioning.

| MD0<br>(Operation mode<br>selection 1) | ON<br>OFF                                       |  | Interrupt posit        | tioning travel dist | tance     | Deceleration time constant |
|--|---|--|------------------------|---------------------|-----------|----------------------------|
| Servo motor<br>speed                   | Forward rotation<br>0 r/min<br>Reverse rotation |  | <mark>&gt; </mark><br> | 0.888 ms            | Dis       | (Note)                     |
| MSD (Mark detec                        | ,   |  | F                      |                     | $\square$ |                            |
| ST1<br>(Forward rotation               | OFF<br>start) ON<br>OFF                         |  |                        |                     |           |                            |

Note. Deceleration time constant of the point table at the time of start is applied for the point table method, and deceleration time constant set by the program in execution is applied for the program method.

#### (5) Using together with other functions

Availability of other functions during the interrupt positioning is as follows:

| Function  | Available<br>(Note 1) |
|---|-----------------------|
| S-pattern acceleration/deceleration                       | 0                     |
| Stroke limit  | 0                     |
| Software limit  | 0                     |
| Temporary stop/restart                                    | ×                     |

| Roll feed display function                                | ×                     |
| Mark detection function (current position latch function) | ×                     |

Note 1.  $\bigcirc$ : enabled,  $\times$ : disabled,  $\triangle$ : enabled with condition

2 Enabled only in a constant speed

ITP (Interrupt positioning) is available with the program function.

Because the interrupt positioning function with MSD (Mark detection) input signal is prioritized, the interrupt positioning function with MSD (Mark detection) can be used during the interrupt positioning function with ITP (Interrupt positioning). However, ITP (Interrupt positioning) cannot be used during the interrupt positioning with MSD (Mark detection).

|  | <ul> <li>Never make a drastic adjustment or change to the parameter values as doing so will make the operation unstable.</li> <li>If fixed values are written in the digits of a parameter, do not change these values.</li> <li>Do not change parameters for manufacturer setting.</li> <li>Do not set any values other than the described setting values to each parameter.</li> </ul> |

|--|--|

#### 7.1 Parameter list

### POINT

- To enable a parameter whose symbol is preceded by \*, turn off the power for 1 s or more after setting and turn it on again. However, the time will be longer depending on a setting value of [Pr. PF25 Instantaneous power failure tough drive Detection time] when "instantaneous power failure tough drive selection" is enabled in [Pr. PA20].
- The symbols in the control mode column mean as follows:
   CP: Positioning mode (point table method)
- CL: Positioning mode (program method)
- Setting a value out of the setting range in each parameter will trigger [AL. 37 Parameter error].

7.1.1 Basic setting parameters ([Pr. PA\_ ])

POINT

- To enable the following parameters in the positioning mode, turn off the power for 1 s or more after setting and turn it on again. However, the time will be longer depending on a setting value of [Pr. PF25 Instantaneous power failure tough drive - Detection time] when "instantaneous power failure tough drive selection" is enabled in [Pr. PA20].
  - [Pr. PA06 Electronic gear numerator (command pulse multiplication numerator)/Number of gear teeth on machine side]
  - [Pr. PA07 Electronic gear denominator (command pulse multiplication denominator)/Number of gear teeth on servo motor side]
- •The following parameter cannot be used in the positioning mode.
  - [Pr. PA05 Number of command input pulses per revolution]

7.1.3 Extension setting parameters ([Pr. PC\_ ])

POINT •To enable the following parameters in the positioning mode, turn off the power for 1 s or more after setting and turn it on again. However, the time will be longer depending on a setting value of [Pr. PF25 Instantaneous power failure tough drive - Detection time] when "instantaneous power failure tough drive selection" is enabled in [Pr. PA20]. [Pr. PC03 S-pattern acceleration/deceleration time constant] • The following parameter cannot be used in the positioning mode. [Pr. PC04 Torque command time constant] [Pr. PC08 Internal speed command 4/internal speed limit 4] [Pr. PC09 Internal speed command 5/internal speed limit 5] [Pr. PC10 Internal speed command 6/internal speed limit 6] [Pr. PC11 Internal speed command 7/internal speed limit 7] [Pr. PC12 Analog speed command - Maximum speed/Analog speed limit -Maximum speed] [Pr. PC13 Analog torque/thrust command maximum output] [Pr. PC23 Function selection C-2] [Pr. PC32 Command input pulse multiplication numerator 2] [Pr. PC33 Command input pulse multiplication numerator 3] • [Pr. PC34 Command input pulse multiplication numerator 4] The following parameters are used for Modbus-RTU communication. For details, refer to "MR-JE- A Servo Amplifier Instruction Manual (Modbus-RTU communication)". [Pr. PC70 Modbus-RTU communication station number setting] [Pr. PC71 Function selection C-F]

• [Pr. PC72 Function selection C-G]

- 7.3 How to set the electronic gear
- Setting [mm], [inch], or [pulse] with "Position data unit" of [Pr. PT01]. Adjust [Pr. PA06] and [Pr. PA07] to match the servo amplifier setting with the travel distance of the machine.

Set the electronic gear within the following range. Setting out of the range will trigger [AL. 37 Parameter error].

(2) Setting [degree] with "Position data unit" of [Pr. PT01]. Set the number of gear teeth on machine side to [Pr. PA06] and the number of gear teeth on servo motor side to [Pr. PA07].

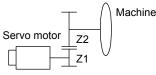

Pt: Servo motor encoder encoder revolution 131072 [pulse/rev] Encoder

Set the electronic gear within the following range. Setting out of the range will trigger [AL. 37 Parameter error].

- (a) Set values to make numerator and denominator 16384 or lower if the electronic gear (CMX/CDV) is reduced to its lowest terms.
- (b) Set values to make numerator and denominator 16777216 or lower if (CMX × Pt)/(CDV × 360000) is reduced to its lowest terms.

The following shows a setting example of the electronic gear. The number of gear teeth on machine side: 25, and the number of gear teeth on servo motor side: 11

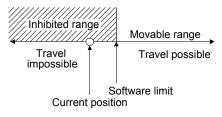

Set [Pr. PA06] = 25 and [Pr. PA07] = 11.

Pt (Servo motor resolution): 131072 pulses/rev Z1: Number of gear teeth on servo motor side Z2: Number of gear teeth on machine side Z1: Z2 = 11:25

#### 7.4 Software limit

The limit stop with the software limit ([Pr. PT15] to [Pr. PT18]) is the same as the motion of the stroke end. Exceeding a setting range will stop and servo-lock the shaft. This will be enabled at power-on and will be disabled at home position return. Setting a same value to "Software limit +" and "Software limit -" will disable this function. Setting a larger value to "Software limit -" than "Software limit +" will trigger [AL. 37.2 Parameter combination error].

7.5 Stop method for LSP (Forward rotation stroke end) off or LSN (Reverse rotation stroke end) off

Select a servo motor stop method for when LSP (Forward rotation stroke end) or LSN (Reverse rotation stroke end) is off with the first digit of [Pr. PD30].

- Stop method selection for LSP (Forward rotation stroke end) off or LSN (Reverse rotation stroke end) off 0: Quick stop (home position erased) 1: Slow stop (home position erased) 2: Slow stop (deceleration to a stop by deceleration time constant) 3: Quick stop (stop by clearing remaining distance)

#### 7.6 Stop method at software limit detection

Select a stop method of the servo motor for when a software limit ([Pr. PT15] to [Pr. PT18]) is detected with the setting of the third digit in [Pr. PD30]. The software limit limits a command position controlled in the servo amplifier. Therefore, actual stop position will not reach the set position of the software limit.

- Stop method selection at software limit detection 0: Quick stop (home position erased) 1: Slow stop (home position erased) 2: Slow stop (deceleration to a stop by deceleration time constant) 2: Quick the development provision distance)
- 3: Quick stop (stop by clearing remaining distance)

POINT

Refer to "MELSERVO-JE Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

•As soon as an alarm occurs, turn SON (Servo-on) off and interrupt the power.

•[AL. 37 Parameter error] and warnings (except [AL. F0 Tough drive warning]) are not recorded in the alarm history.

When an error occurs during operation, the corresponding alarm or warning is displayed. When the alarm occurs, refer to "MELSERVO-JE Servo Amplifier Instruction Manual (Troubleshooting)" to remove the failure. When an alarm occurs, ALM (Malfunction) will turn off.

If any warning occurs, refer to section 1.5 and take the appropriate action.

- 8.1 Explanations of the lists
- (1) No./Name/Detail No./Detail name Indicates the alarm or warning No., name, detail No., and detail name.
- (2) Stop method

For the alarms and warnings in which "SD" is written in the stop method column, the servo motor stops with the dynamic brake after forced stop deceleration. For the alarms and warnings in which "DB" or "EDB" is written in the stop method column, the servo motor stops with the dynamic brake without forced stop deceleration.

(3) Alarm deactivation

After the alarm cause has been removed, the alarm can be deactivated in any of the methods marked **O** in the alarm deactivation column. Warnings are automatically canceled after the cause of occurrence is removed. Alarms are deactivated by alarm reset, CPU reset, or power cycling.

| Alarm deactivation | Explanation   |
|--------------------|---|
| Alarm reset        | <ol> <li>Turn on RES (Reset) with an input device.</li> <li>Press the "SET" button while the display of the servo amplifier is in the current<br/>alarm display mode.</li> <li>Click the "Occurring Alarm Reset" button in the "Alarm Display" window of MR<br/>Configurator2.</li> </ol> |
| Cycling the power  | Turn off the power, check that the 5-digit, 7-segment LED display is off, and then turn on the power.   |

#### (4) Alarm code

Alarm codes are outputted only from the MR-JE-\_A. To output alarm codes, set [Pr. PD34] to "\_\_\_\_1" when using an MR-JE-\_A. Alarm codes are outputted by turning on/off bit 0 to bit 2. Warnings ([AL. 90] to [AL. F3]) do not have alarm codes. The alarm codes in the following table will be outputted when they occur. The alarm codes will not be outputted in normal condition.

#### 8.2 Alarm and warning list

When an error occurs during operation, the corresponding alarm or warning is displayed. If any alarm or warning has occurred, refer to section 8.2 or 8.3 and take the appropriate action. When an alarm occurs, ALM (Malfunction) will turn off.

To output alarm codes, set [Pr. PD34] to "\_\_\_1". Alarm codes are outputted by turning on/off of bit 0 to bit 2. Warnings ([AL. 91] to [AL. F3]) do not have alarm codes. The alarm codes in the following table will be outputted when they occur. The alarm codes will not be outputted in normal condition.

After the alarm cause has been removed, the alarm can be deactivated in any of the methods marked **O** in the alarm deactivation column. Warnings are automatically canceled after the cause of occurrence is removed.

For the alarms and warnings in which "SD" is written in the stop method column, the servo motor stops with the dynamic brake after forced stop deceleration. For the alarms and warnings written "DB" in the stop method column, the servo motor stops with the dynamic brake without forced stop deceleration.

|       | 88888 |                          | $\geq$               | $\backslash$         | Watchdog  | 8888                | Watchdog   | SD                            |                         |   | 0                           |

Note 1. Leave for about 30 minutes of cooling time after removing the cause of occurrence.

2. The following shows three stop methods of DB, EDB, and SD.

DB: Dynamic brake stop (For a servo amplifier without the dynamic brake, the servo motor coasts.)

EDB: Electronic dynamic brake stop (available with specified servo motors)

Refer to the following table for the specified servo motors. DB is applied as the stop method for other than the specified servo motor.

For MR-JE\_A, setting [Pr. PF09] to "(\_ \_ \_ 3)" enables the electronic dynamic brake.

| Series | Servo motor                      |
|--------|----------------------------------|
| HG-KN  | HG-KN053/HG-KN13/HG-KN23/HG-KN43 |
| HG-SN  | HG-SN52                          |

SD: Forced stop deceleration

3. This is applicable when [Pr. PA04] is set to the initial value. The stop method of SD can be changed to DB using [Pr. PA04].

4. To cancel the alarm, turn off the power and check that the 5-digit, 7-segment LED display is off, and then turn on the power.

#### 8.4 Warning list

|             |     | control warning                              | F6.4                | Cam control data setting range error                |                               |
|             |     |  | F6.5                | Cam No. external error                              |                               |
|             |     |  | F6.6                | Cam control inactive                                |                               |

Note 1. Leave for about 30 minutes of cooling time after removing the cause of occurrence.

2. The following shows two stop methods of DB and SD.

- DB: Stop with dynamic brake

- SD: Forced stop deceleration

3. This is applicable when [Pr. PA04] is set to the initial value. The stop method of SD can be changed to DB using [Pr. PA04].

4. Quick stop or slow stop can be selected using [Pr. PD30].

## 9. OPTIONS AND PERIPHERAL EQUIPMENT

|  | Before connecting any option or peripheral equipment, turn off the power and wait<br>for 15 minutes or more until the charge lamp turns off. Then, confirm that the<br>voltage between P+ and N- is safe with a voltage tester and others. Otherwise, an<br>electric shock may occur. In addition, when confirming whether the charge lamp is<br>off or not, always confirm it from the front of the servo amplifier. |
|--|---|
|--|---|

CAUTION •Use the specified peripheral equipment and options to prevent a malfunction or a fire.

For the details of the following items, refer to chapter/section (of "MR-JE-\_A Servo Amplifier Instruction Manual") indicated in the table.

| Item   | Detailed explanation |
|--|----------------------|
| item   | MR-JEA               |
| Cable/connector sets                                     | Section 11.1         |
| Regenerative option                                      | Section 11.2         |
| Junction terminal block MR-TB50                          | Section 11.3         |
| MR Configurator2   | Section 11.4         |
| Selection example of wires                               | Section 11.5         |

#### 9.1 MR-HDP01 manual pulse generator

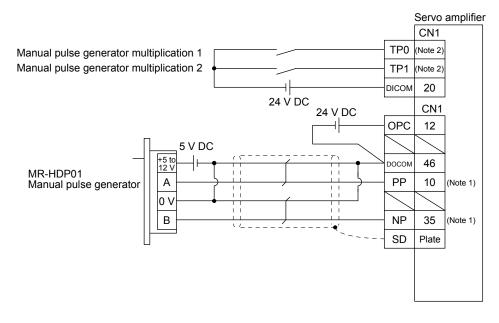

| POINT          |  |
|----------------|--|
| When using     | an MR-HDP01, set [Pr. PA13 Command pulse input form] to "_ 2 _ |
| 2" or "_ 3 _ 2 | 2".  |
| Configure M    | R-HDP01 with sink interface.                                   |

You can operate servo motors by using MR-HDP01 manual pulse generator. A multiplication to pulse signals which MR-HDP01 generates with external input signals can be changed with TP0 (Manual pulse generator multiplication 1) and TP1 (Manual pulse generator multiplication 2).

#### (1) Specifications

| Item                            |                     | Specifications  |  |  |
|---------------------------------|---------------------|---|--|--|
| Dewen even h                    | Voltage             | 4.5 V DC to 13.2 V DC                                   |  |  |
| Power supply                    | Consumption current | 60 mA or less   |  |  |
| Interface                       |                     | Maximum output current: 20 mA for open collector output |  |  |
| Pulse signal form               |                     | A-phase/B-phase, 2 signals of 90° phase difference      |  |  |
| Pulse resolution                |                     | 100 pulses/rev  |  |  |
| Maximum speed                   |                     | Instantaneous maximum: 600 r/min, normal: 200 r/min     |  |  |
| Temperature range for operation |                     | -10 °C to 60 °C   |  |  |
| Temperature range for storage   |                     | -30 °C to 80 °C   |  |  |

#### (2) Connection example

- Note 1. To assign PP and NP, set [Pr. PD44] and [Pr. PD46] to "0 0 \_ \_".
  2. To use this as an input device, assign to specified pin of the CN1 connector with [Pr.
  - PD04] to [Pr. PD22].

## 9. OPTIONS AND PERIPHERAL EQUIPMENT

#### (3) Terminal assignment

[Unit: mm]

| Signal name | Description                 |
|-------------|-----------------------------|
| +5 to 12 V  | Power supply input          |
| 0 V         | Common for power and signal |
| A           | A-phase output pulse        |
| В           | B-phase output pulse        |

[Unit: mm]

| Prohibiting/canceling I/O devices (DIO) | Section 12.5.6       |  |  |
| Alarm history                           | Section 12.5.10      |  |  |
| Current alarm                           | Section 12.5.11      |  |  |
| Software version                        | Section 12.5.12      |  |  |

#### POINT

•Creating and reading programs are not available with Mitsubishi generalpurpose AC servo protocol (RS-422 communication). Use MR Configurator2.

#### 10.1 Command and data No. list

| POINT |
|-------|
|-------|

Even if a command or data No. is the same between different model servo amplifiers, its description may differ.

• The symbols in the control mode column mean as follows:

CP: Positioning mode (point table method)

CL: Positioning mode (program method)

#### 10.1.1 Reading command

## (1) Status display (command [0] [1])

| Command | Data No. | Description                    | Status display                   | Control<br>mode<br>C C<br>P L | Frame<br>length |

# 10. COMMUNICATION FUNCTION (MITSUBISHI GENERAL-PURPOSE AC SERVO PROTOCOL)

## 10.1.2 Writing commands

## (1) Status display (command [8] [1])

| Command | Data No. | Description                  | Setting range | Cont<br>mod<br>C<br>P |   | Frame<br>length |
|---------|----------|------------------------------|---------------|-----------------------|---|-----------------|
| [8] [1] | [0] [0]  | Deleting status display data | 1EA5          | 0                     | 0 | 4               |

# (2) Parameter (command [9] [4], [8] [5])

| Command | Data No.           | Description   | Setting range                           |   | ntrol<br>ode<br>C<br>L | Frame<br>length |
|---------|--------------------|---|---|---|------------------------|-----------------|
| [9] [4] | [0] [1] to [F] [F] | Writing each parameter<br>Writes the values of the parameters in the parameter group<br>specified with the command [8] [5] + data No. [0] [0].<br>Therefore, be sure to specify the parameter group with the<br>command [8] [5] + data No. [0] [0] before writing the values.<br>The data No. (hexadecimal) value which is converted to<br>decimal corresponds to the parameter No. | Varies<br>depending on<br>the parameter | 0 | 0                      | 12              |
| [8] [5] | [0] [0]            | Writing parameter group<br>0000: Basic setting parameters ([Pr. PA])<br>0001: Gain/filter parameters ([Pr. PB])<br>0002: Extension setting parameters ([Pr. PC])<br>0003: I/O setting parameters ([Pr. PD])<br>0004: Extension setting 2 parameters ([Pr. PE])<br>0005: Extension setting 3 parameters ([Pr. PF])<br>000C:Positioning control parameters ([Pr. PT])                 | 0000 to 000C                            | 0 | 0                      | 4               |

#### (3) External I/O signals (command [9] [2])

| Command | Data No.           | Description | Setting range            | Cor<br>mc<br>C<br>P |   | Frame<br>length |
|---------|--------------------|-------------|--------------------------|---------------------|---|-----------------|
| [9] [2] | [6] [0] to [6] [2] |             | Refer to section 10.2.2. | 0                   | 0 | 8               |

#### (4) Alarm history (command [8] [2])

| Command | Data No. | Description            | Setting range | Contro<br>mode<br>C C<br>P L | Frame |
|---------|----------|------------------------|---------------|------------------------------|-------|
| [8] [2] | [2] [0]  | Clearing alarm history | 1EA5          | 00                           | ) 4   |

#### (5) Current alarm (command [8] [2])

| Command | Data No. | Description    | Setting range | Con<br>mo<br>C<br>P |   | Frame<br>length |
|---------|----------|----------------|---------------|---------------------|---|-----------------|
| [8] [2] | [0] [0]  | Clearing alarm | 1EA5          | 0                   | 0 | 4               |

| Command | Data No. | Description  | Setting range | Cor<br>mc<br>C<br>P | ntrol<br>ode<br>C<br>L | Frame<br>length |
|---------|----------|--|---------------|---------------------|------------------------|-----------------|
| [9] [0] | [0] [0]  | Turns off the input devices except EM2, LSP and LSN,<br>external analog input signals, and pulse train inputs,<br>independently of the external on/off status. | 1EA5          | 0                   | 0                      | 4               |
|         | [0] [3]  | Prohibits all output devices (DO).   | 1EA5          | 0                   | 0                      |                 |
|         | [1] [0]  | Cancels the prohibition of the input devices except EM2, LSP and LSN, external analog input signals and pulse train inputs.                                    | 1EA5          | 0                   | 0                      |                 |
|         | [1] [3]  | Cancels the prohibition of the output device.  | 1EA5          | 0                   | 0                      |                 |

## (6) I/O device prohibition (command [9] [0])

# (7) Operation mode selection (command [8] [B])

| Command | Data No. | Description   | Setting range               | Cor<br>mc<br>C<br>P | ntrol<br>ode<br>C<br>L | Frame<br>length |
|---------|----------|---|-----------------------------|---------------------|------------------------|-----------------|
| [8] [B] | [0] [0]  | Selecting test operation mode<br>0000: Test operation mode cancel<br>0001: JOG operation<br>0002: Positioning operation<br>0004: Output signal (DO) forced output<br>0005: Single-step feed operation | 0000 to 0002,<br>0004, 0005 | 0                   | 0                      | 4               |

|         |                    |  |   |        | ntrol<br>ode | Frame  |
|---------|--------------------|--|---|--------|--------------|--------|
| Command | Data No.           | Description  | Setting range   | C<br>P | C<br>L       | length |
| [9] [2] | [0] [0] to [0] [2] | Input signal for test operation  | Refer to<br>section 14.5.7<br>of "MR-JEA<br>Servo Amplifier<br>Instruction<br>Manual".    | 0      | 0            | 8      |
|         | [A] [0]            | Forced output of signal pin  | Refer to<br>section 14.5.9<br>of "MR-JEA<br>Servo<br>Amplifier<br>Instruction<br>Manual". | 0      | 0            |        |
| [A] [0] | [1] [0]            | Writes the servo motor speed in the test operation mode (JOG operation and positioning operation).   | 0000 to 7FFF  | 0      | 0            | 4      |
|         | [1] [1]            | Writes the acceleration/deceleration time constant in the test operation mode (JOG operation and positioning operation).   | 00000000 to<br>7FFFFFF  | 0      | 0            | 8      |
|         | [2] [0]            | Set the travel distance of the test operation mode (positioning operation).  | 00000000 to<br>7FFFFFF  | 0      | 0            |        |
|         | [2] [1]            | Select the positioning direction of the test operation<br>(positioning operation).   | 0000 to 0101  | 0      | 0            | 4      |
|         | [4] [0]            | This is a start command of the test operation (positioning operation).   | 1EA5  | 0      | 0            |        |
|         | [4] [1]            | Use this to make a temporary stop during test operation<br>(positioning operation). "□" in the data indicates a blank.<br>STOP: Temporary stop<br>GO□□: Restart for remaining distance<br>CLR□: Remaining distance clear | STOP<br>GO□□<br>CLR□  | 0      | 0            |        |

# (8) Test operation mode data (command [9] [2], [A] [0])

| 0       | Data Na            | Description   | Osttingener                  | Control mode |             |        |
|---------|--------------------|---|------------------------------|--------------|-------------|--------|
| Command | Data No.           | Description   | Setting range                | C<br>P       | C<br>L      | length |
| [C] [0] | [0] [1] to [1] [F] | Writing position data of each point table<br>The data No. (hexadecimal) value which is converted to<br>decimal corresponds to the point table No.   | -999999 to<br>999999         | 0            |             | 8      |
| [C] [2] | [0] [1] to [1] [F] | Writing M code of each point table<br>This command will be available in the future.<br>The data No. (hexadecimal) value which is converted to<br>decimal corresponds to the point table No. | 0 to 99                      | 0            | $\setminus$ |        |
| [C] [6] | [0] [1] to [1] [F] | Writing speed data of each point table<br>The data No. (hexadecimal) value which is converted to<br>decimal corresponds to the point table No.  | 0 to<br>permissible<br>speed | 0            | $\setminus$ |        |
| [C] [7] | [0] [1] to [1] [F] | Writing acceleration time constant of each point table<br>The data No. (hexadecimal) value which is converted to<br>decimal corresponds to the point table No.                              | 0 to 20000                   | 0            | $\setminus$ |        |
| [C] [8] | [0] [1] to [1] [F] | Writing deceleration time constant of each point table<br>The data No. (hexadecimal) value which is converted to<br>decimal corresponds to the point table No.                              | 0 to 20000                   | 0            |             |        |
| [C] [A] | [0] [1] to [1] [F] | Writing dwell of each point table<br>The data No. (hexadecimal) value which is converted to<br>decimal corresponds to the point table No.   | 0 to 20000                   | 0            |             |        |
| [C] [B] | [0] [1] to [1] [F] | Writing sub function of each point table<br>The data No. (hexadecimal) value which is converted to<br>decimal corresponds to the point table No.  | 0 to 3, 8 to 11              | 0            |             |        |

# (9) Point table setting data (command [C] [0], [C] [2], [C] [6], [C] [7], [C] [8], [C] [A], [C] [B])

# (10) General purpose register (Rx) value (command [B] [9])

| Command | Data No. | Description                                 | Setting range             | Contro<br>mode<br>C C<br>P L |   |
|---------|----------|---|---------------------------|------------------------------|---|
| [B] [9] | [0] [1]  | Writing general purpose register (R1) value | Varies                    | No                           | 8 |
|         | [0] [2]  | Writing general purpose register (R2) value | depending on              | No                           | ) |
|         | [0] [3]  | Writing general purpose register (R3) value | the commands              | $\setminus \circ$            | 1 |
|         | [0] [4]  | Writing general purpose register (R4) value | (Refer to section 5.2.2.) | $\backslash \circ$           |   |

# (11) General purpose register (Dx) value (command [B] [A])

| Command | Data No. | Description                                 | Setting range             | Contro<br>mode<br>C C<br>P L | -   |
|---------|----------|---|---------------------------|------------------------------|-----|
| [B] [A] | [0] [1]  | Writing general purpose register (D1) value | Varies                    | $\setminus c$                | ) 8 |
|         | [0] [2]  | Writing general purpose register (D2) value | depending on              | $\sum c$                     | )   |
|         | [0] [3]  | Writing general purpose register (D3) value | the commands              | $\sum c$                     | )   |
|         | [0] [4]  | Writing general purpose register (D4) value | (Refer to section 5.2.2.) |                              | )   |

- 10.2 Detailed explanations of commands
- 10.2.1 External I/O signal status (DIO diagnosis)
- (1) Reading input device status

The current input device status can be read.

(a) Transmission

Transmit command [1] [2] + data No. [0] [0] to [0] [2].

| Command | Data No.           |
|---------|--------------------|
| [1] [2] | [0] [0] to [0] [2] |

#### (b) Return

The slave station returns the status of the input devices.

Command of each bit is transmitted to the master station as hexadecimal data.

| Bit | Symbol           |                  |                  |  |  |  |
|-----|------------------|------------------|------------------|--|--|--|
| BI  | Data No. [0] [0] | Data No. [0] [1] | Data No. [0] [2] |  |  |  |
| 0   | SON              |                  | MD0              |  |  |  |
| 1   | LSP              |                  | MD1              |  |  |  |
| 2   | LSN              |                  |                  |  |  |  |
| 3   | TL               |                  | ТСН              |  |  |  |
| 4   | TL1              |                  | TP0              |  |  |  |
| 5   | PC               |                  | TP1              |  |  |  |
| 6   | RES              |                  | OVR              |  |  |  |

| 27  | CDP              |                  | DI3              |  |  |  |
| 28  |                  |                  | DI4              |  |  |  |
| 29  |                  |                  |                  |  |  |  |
| 30  |                  |                  |                  |  |  |  |
| 31  |                  |                  |                  |  |  |  |

#### (2) Reading external input pin status

Reads the on/off statuses of the external input pins.

(a) Transmission

Transmit command [1] [2] + data No. [4] [0].

| Command | Data No. |
|---------|----------|
| [1] [2] | [4] [0]  |

#### (b) Return

The on/off statuses of the input pins are returned.

| b31 | <br> | <br>b1b0 |                 |
|-----|------|----------|-----------------|
|     |      |          | 1: On<br>0: Off |

Command of each bit is transmitted to the master station as hexadecimal data.

| Bit | CN1 connector pin | Bit | CN1 connector pin |
|-----|-------------------|-----|-------------------|
| 0   | 43                | 16  |                   |
| 1   | 44                | 17  |                   |
| 2   | 42                | 18  |                   |
| 3   | 15                | 19  |                   |
| 4   | 19                | 20  |                   |
| 5   | 41                | 21  |                   |
| 6   | 10 (Note)         | 22  |                   |
| 7   | 35 (Note)         | 23  |                   |
| 8   |                   | 24  |                   |
| 9   |                   | 25  |                   |
| 10  |                   | 26  |                   |
| 11  |                   | 27  |                   |
| 12  |                   | 28  |                   |
| 13  |                   | 29  |                   |
| 14  |                   | 30  |                   |
| 15  |                   | 31  |                   |

Note. When the pulse train input is selected with [Pr. PD44] or [Pr. PD46], this bit will be always "0" (off).

# (3) Reading the status of input devices switched on with communication Reads the on/off statuses of the input devices switched on with communication.

(a) Transmission

Transmit command [1] [2] + data No. [6] [0] to [6] [2].

| Command | Data No.           |
|---------|--------------------|
| [1] [2] | [6] [0] to [6] [2] |

#### (b) Return

The slave station returns the status of the input devices.

| b31 | <br> | <br>b1b0 |                 |
|-----|------|----------|-----------------|
|     |      |          | 1: On<br>0: Off |

Command of each bit is transmitted to the master station as hexadecimal data.

| Bit | Symbol           |                  |                  |  |  |  |
|-----|------------------|------------------|------------------|--|--|--|
| BI  | Data No. [6] [0] | Data No. [6] [1] | Data No. [6] [2] |  |  |  |

## (4) Reading external output pin status

Reads the on/off statuses of the external output pins.

(a) Transmission

Transmit command [1] [2] + data No. [C] [0].

| Command | Data No. |
|---------|----------|
| [1] [2] | [C] [0]  |

#### (b) Return

The slave station returns the status of the output devices.

| b31 | <br> | b1b0 |                 |
|-----|------|------|-----------------|
|     |      |      | 1: On<br>0: Off |

Command of each bit is transmitted to the master station as hexadecimal data.

| Bit | CN1 connector pin | Bit | CN1 connector pin |
|-----|-------------------|-----|-------------------|
| 0   | 49                | 16  |                   |
| 1   | 24                | 17  |                   |
| 2   | 23                | 18  |                   |
| 3   |                   | 19  |                   |
| 4   |                   | 20  |                   |
| 5   | 48                | 21  |                   |
| 6   | 33                | 22  |                   |
| 7   |                   | 23  |                   |
| 8   |                   | 24  |                   |
| 9   |                   | 25  |                   |
| 10  |                   | 26  |                   |
| 11  |                   | 27  |                   |
| 12  |                   | 28  |                   |
| 13  |                   | 29  |                   |
| 14  |                   | 30  |                   |
| 15  |                   | 31  |                   |

#### (5) Reading output device status

Reads the on/off statuses of the output devices.

(a) Transmission

Transmit command [1] [2] + data No. [8] [0] to [8] [3].

| Command | Data No.           |
|---------|--------------------|
| [1] [2] | [8] [0] to [8] [3] |

#### (b) Return

The slave station returns the status of the input/output devices.

| b3 | 31 | <br> | <br>- | - | - | - | <br> | <br> | <br>- | - | - | - | <br> | - | <br> | <br> | - | - | <br> | <br> | - | <br> | - | - | - | b1 | bC | ) |              |         |
|----|----|------|-------|---|---|---|------|------|-------|---|---|---|------|---|------|------|---|---|------|------|---|------|---|---|---|----|----|---|--------------|---------|
|    |    |      |       |   |   |   |      |      |       |   |   |   |      |   |      |      |   |   |      |      |   |      |   |   |   |    |    |   | 1: 0<br>0: 0 | n<br>ff |

Command of each bit is transmitted to the master station as hexadecimal data.

| Dit |                  | Syr              | nbol             |                  |
|-----|------------------|------------------|------------------|------------------|

| 26  |                  | CLTS             | PT2 (Note)       |                  |
| 27  |                  | CLTSM            | PT3 (Note)       |                  |
| 28  |                  | CPCC             | PT4 (Note)       |                  |
| 29  |                  |                  |                  |                  |
| 30  |                  |                  |                  |                  |
| 31  | MTTR             |                  |                  |                  |

Note. For MR-JE-\_A servo amplifiers, up to four points of DO are available; therefore, PT0 to PT4 cannot be outputted simultaneously.

10.2.2 Input device on/off

POINT

• The on/off status of all devices in the servo amplifier are the status of the data received at last. Therefore, when there is a device which must be kept on, transmit data which turns the device on every time.

Each input device can be switched on/off. However, when the device to be switched off is in the external input signal, also switch off the input signal.

Transmit command [9] [2] + data No. [6] [0] to [6] [2].

Command of each bit is transmitted to the master station as hexadecimal data.

| Bit |                  | Symbol           |                  |
|-----|------------------|------------------|------------------|
| Dit | Data No. [6] [0] | Data No. [6] [1] | Data No. [6] [2] |

| 25  |                  | CLTC             | DI1              |
| 26  |                  | CPCD             | DI2              |
| 27  | CDP              |                  | DI3              |
| 28  |                  |                  | DI4              |
| 29  |                  |                  |                  |
| 30  |                  |                  |                  |
| 31  |                  |                  |                  |

10.2.3 Input device on/off (for test operation)

Each input devices can be turned on/off for test operation. However, when the device to be switched off is in the external input signal, also switch off the input signal.

Transmit command [9] [2] + data No. [0] [0] to [0] [2].

| Bit |                  | Symbol           |                  |
|-----|------------------|------------------|------------------|
| DIL | Data No. [0] [0] | Data No. [0] [1] | Data No. [0] [2] |
| 0   | SON              |                  | MD0              |
| 1   | LSP              |                  | MD1              |
| 2   | LSN              |                  |                  |
| 3   | TL               |                  | ТСН              |
| 4   | TL1              |                  | TP0              |
| 5   | PC               |                  | TP1              |
| 6   | RES              |                  | OVR              |
| 7   | CR               |                  |                  |
| 8   | SP1              |                  |                  |
| 9   | SP2              |                  | DOG              |
| 10  | SP3              |                  |                  |
| 11  | ST1/RS2          |                  |                  |
| 12  | ST2/RS1          |                  |                  |
| 13  | CMX1             |                  |                  |
| 14  | CMX2             |                  |                  |
| 15  | LOP              |                  |                  |
| 16  |                  | MSD              | LPS              |
| 17  |                  | PI1              |                  |
| 18  | EM2/EM1          | PI2              |                  |
| 19  |                  | PI3              |                  |
| 20  | STAB2            | CAMC             | OV0              |
| 21  |                  | CIO              | OV1              |
| 22  |                  | Cl1              | OV2              |
| 23  |                  | Cl2              | OV3              |
| 24  | TSTP             | Cl3              | DIO              |
| 25  |                  | CLTC             | DI1              |
| 26  |                  | CPCD             | DI2              |
| 27  | CDP              |                  | DI3              |
| 28  |                  |                  | DI4              |
| 29  |                  |                  |                  |
| 30  |                  |                  |                  |
| 31  |                  |                  |                  |

Command of each bit is transmitted to the master station as hexadecimal data.

#### 10.2.4 Test operation mode

| POINT |
|-------|
|-------|

- The test operation mode is for checking an operation. Do not use it for an actual operation.
- If communication stops for 0.5 s or longer during the test operation, the servo motor decelerates to a stop, resulting in servo-lock. To prevent this, keep the communication all the time by checking the status display, etc.
- The test operation mode can be started even in operation. In this case, switching to the test operation mode will shut off the base circuit to coast the servo motor.
- (1) How to prepare and cancel the test operation mode
  - (a) Preparation of the test operation mode
     Set the test operation mode type with the following procedure.
    - 1) Setting of test operation mode

Transmit the command [8] [B] + data No. [0] [0] + data to set the test operation mode.

| Command | Data No. | Transmission data | Setting test operation mode             |
|---------|----------|-------------------|---|
| [0] [D] | [0] [0]  | 0004              | Output signal (DO) forced output (Note) |
| [8] [B] | [0] [0]  | 0005              | Single-step feed                        |

Note. Refer to section 10.2.5 for the output signal (DO) forced output.

#### 2) Check of test operation mode

Read the test operation mode set for the slave station, and check that it is set correctly.

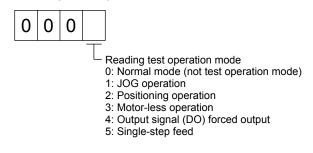

a) Transmission

Transmit command [0] [0] + data No. [1] [2].

| Command | Data No. |
|---------|----------|
| [0] [0] | [1] [2]  |

#### b) Return

The slave station returns the preset operation mode.

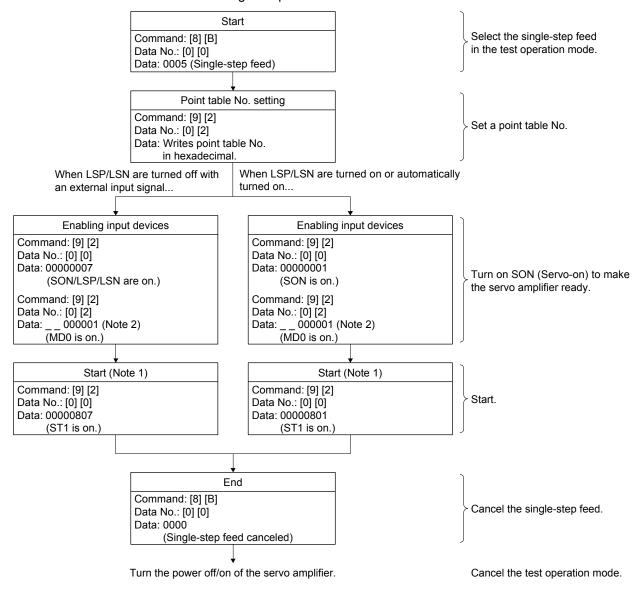

#### (b) Cancel of test operation mode

To stop the test operation mode, transmit the command [8] [B] + data No. [0] [0] + data. Turn off the servo amplifier before switching the operation mode from the test to the normal.

| Command | Data No. | Transmission data | Setting test operation mode |
|---------|----------|-------------------|-----------------------------|
| [8] [B] | [0] [0]  | 0000              | Test operation mode cancel  |

#### (2) Single-step feed

Set each value of target point tables for the single-step feed before executing single-step feed. Transmit command and data No. to execute single-step feed.

- Note 1. Start it after checking ZP (Home position return completion). See the 4 bit of the read data with the command [1] [2] and data No. [8] [2].
  - 2. A point table No. in hexadecimal will be entered to "\_\_".

## 10.2.5 Output signal pin on/off (output signal (DO) forced output)

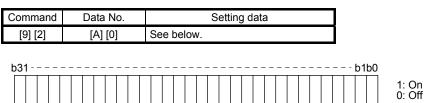

In the test operation mode, the output signal pins can be turned on/off regardless of the servo status. Disable the external input signals in advance with command [9] [0].

 Selecting the output signal (DO) forced output of the test operation mode Transmit command + [8] [B] + data No. [0] [0] + data "0004" to select the output signal (DO) forced output.

#### (2) External output signal on/off

Transmit the following communication commands.

Command of each bit is transmitted to the master station as hexadecimal data

| Bit | CN1 connector pin | Bit | CN1 connector pin |
|-----|-------------------|-----|-------------------|
| 0   | 49                | 16  |                   |
| 1   | 24                | 17  |                   |
| 2   | 23                | 18  |                   |
| 3   |                   | 19  |                   |
| 4   |                   | 20  |                   |
| 5   | 48                | 21  |                   |
| 6   | 33                | 22  |                   |
| 7   |                   | 23  |                   |
| 8   |                   | 24  |                   |
| 9   |                   | 25  |                   |
| 10  |                   | 26  |                   |
| 11  |                   | 27  |                   |
| 12  |                   | 28  |                   |
| 13  |                   | 29  |                   |
| 14  |                   | 30  |                   |
| 15  |                   | 31  |                   |

# (3) Output signal (DO) forced output

To stop the output signal (DO) forced output, transmit command [8] [B] + data No. [0] [0] + data. Turn off the servo amplifier before switching the operation mode from the test to the normal.

| Command | Data No. | Transmission data | Setting test operation mode |
|---------|----------|-------------------|-----------------------------|
| [8] [B] | [0] [0]  | 0000              | Test operation mode cancel  |

## 10.2.6 Point table

## (1) Reading data

(a) Position data

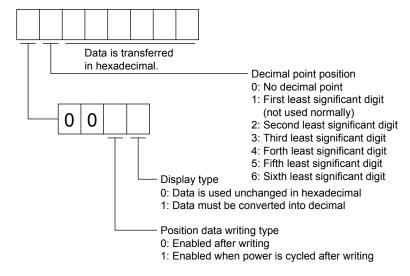

Reads position data of point tables.

1) Transmission

Transmits the command [4] [0] + the data No. [0] [1] to [1] [F] corresponding to the point tables to read. Refer to section 10.1.1.

2) Return

The slave station returns the position data of point table requested.

#### (b) Speed data

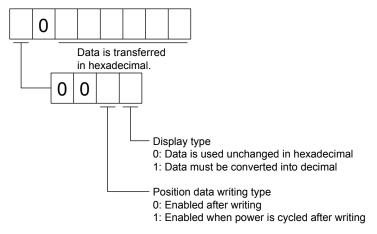

Reads speed data of point tables.

1) Transmission

Transmits the command [5] [0] + the data No. [0] [1] to [1] [F] corresponding to the point tables to read. Refer to section 10.1.1.

2) Return

The slave station returns the speed data of point table requested.

## (c) Acceleration time constant

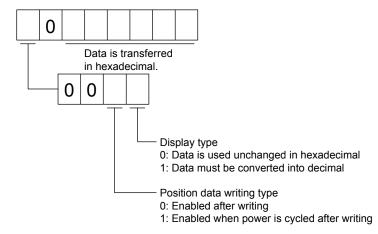

Reads acceleration time constant of point tables.

1) Transmission

Transmits the command [5] [4] + the data No. [0] [1] to [1] [F] corresponding to the point tables to read. Refer to section 10.1.1.

2) Return

The slave station returns the acceleration time constant of point table requested.

## (d) Deceleration time constant

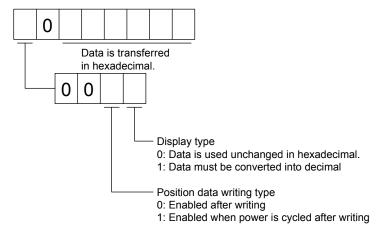

Reads deceleration time constant of point tables.

1) Transmission

Transmits the command [5] [8] + the data No. [0] [1] to [1] [F] corresponding to the point tables to read. Refer to section 10.1.1.

2) Return

The slave station returns the deceleration time constant of point table requested.

# (e) Dwell

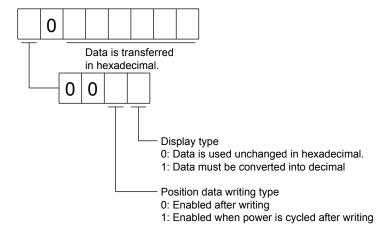

Reads dwell of point tables.

1) Transmission

Transmits the command [6] [0] + the data No. [0] [1] to [1] [F] corresponding to the point tables to read. Refer to section 10.1.1.

2) Return

The slave station returns the dwell of point table requested.

## (f) Sub function

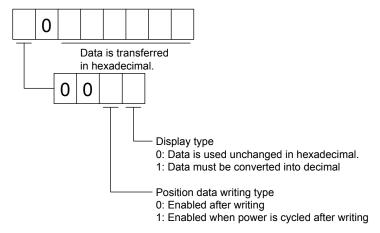

Reads sub function of point tables.

1) Transmission

Transmits the command [6] [4] + the data No. [0] [1] to [1] [F] corresponding to the point tables to read. Refer to section 10.1.1.

2) Return

The slave station returns the sub function of point table requested.

## (g) M code

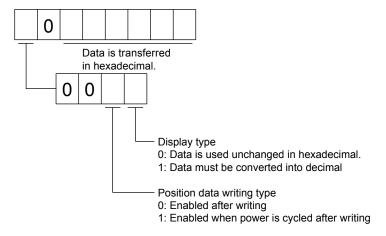

Reads M code of point tables. M code will be available in the future.

1) Transmission

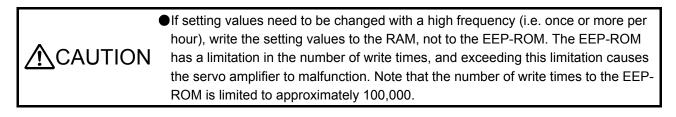

Transmits the command [4] [5] + the data No. [0] [1] to [1] [F] corresponding to the point tables to read. Refer to section 10.1.1.

2) Return

The slave station returns the M code of point table requested.

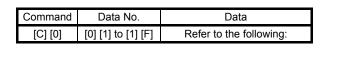

## (2) Writing data

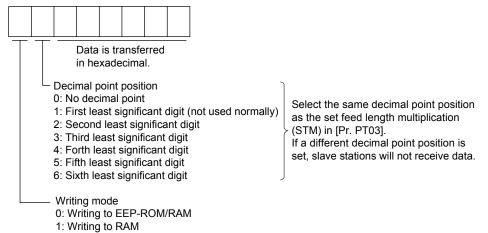

#### (a) Position data

Writes position data of point tables.

Transmits the command [C] [0] + the data No. [0] [1] to [1] [F] corresponding to the point tables to write. Refer to section 10.1.1.

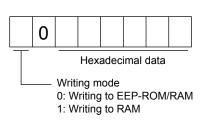

When changing the position data frequently using communication, set "1" to the write mode to change only the RAM data in the servo amplifier.

## (b) Speed data

Writes speed data of point tables.

Transmits the command [C] [6] + the data No. [0] [1] to [1] [F] corresponding to the point tables to write. Refer to section 10.1.1.

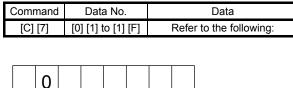

When changing the speed data frequently using communication, set "1" to the write mode to change only the RAM data in the servo amplifier.

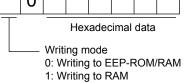

When changing data once or more within an hour, do not write it to the EEP-ROM.

## (c) Acceleration time constant

Writes acceleration time constant of point tables.

Transmits the command [C] [7] + the data No. [0] [1] to [1] [F] corresponding to the point tables to write. Refer to section 10.1.1.

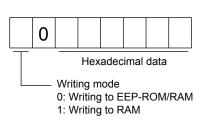

When changing the acceleration time constant frequently using communication, set "1" to the write mode to change only the RAM data in the servo amplifier.

## (d) Deceleration time constant

Writes deceleration time constant of point tables.

Transmits the command [C] [8] + the data No. [0] [1] to [1] [F] corresponding to the point tables to write. Refer to section 10.1.1.

When changing the deceleration time constant frequently using communication, set "1" to the write mode to change only the RAM data in the servo amplifier.

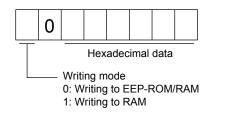

When changing data once or more within an hour, do not write it to the EEP-ROM.

## (e) Dwell

Writes dwell of point tables.

Transmits the command [C] [A] + the data No. [0] [1] to [1] [F] corresponding to the point tables to write. Refer to section 10.1.1.

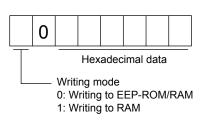

When changing the dwell frequently using communication, set "1" to the wirte mode to change only the RAM data in the servo amplifier.

# (f) Sub function

Writes sub function of point tables.

Transmits the command [C] [B] + the data No. [0] [1] to [1] [F] corresponding to the point tables to write. Refer to section 10.1.1.

When changing the sub function frequently using communication, set "1" to the write mode to change only the RAM data in the servo amplifier.

When changing data once or more within an hour, do not write it to the EEP-ROM.

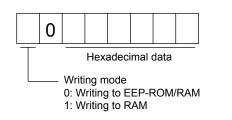

## (g) M code

Writes M code of point tables.

M code will be available in the future.

Transmits the command [C] [2] + the data No. [0] [1] to [1] [F] corresponding to the point tables to write. Refer to section 10.1.1.

| Command | Data No.           | Data                    |
|---------|--------------------|-------------------------|
| [C] [2] | [0] [1] to [1] [F] | Refer to the following: |

When changing the M code frequently using communication, set "1" to the write mode to change only the RAM data in the servo amplifier.

# Warranty

#### 1. Warranty period and coverage

We will repair any failure or defect hereinafter referred to as "failure" in our FA equipment hereinafter referred to as the "Product" arisen during warranty period at no charge due to causes for which we are responsible through the distributor from which you purchased the Product or our service provider. However, we will charge the actual cost of dispatching our engineer for an on-site repair work on request by customer in Japan or overseas countries. We are not responsible for any on-site readjustment and/or trial run that may be required after a defective unit are repaired or replaced.

#### [Term]

The term of warranty for Product is twelve (12) months after your purchase or delivery of the Product to a place designated by you or eighteen (18) months from the date of manufacture whichever comes first ("Warranty Period"). Warranty period for repaired Product cannot exceed beyond the original warranty period before any repair work.

#### [Limitations]

- (1) You are requested to conduct an initial failure diagnosis by yourself, as a general rule.
- It can also be carried out by us or our service company upon your request and the actual cost will be charged. However, it will not be charged if we are responsible for the cause of the failure.
- (2) This limited warranty applies only when the condition, method, environment, etc. of use are in compliance with the terms and conditions and instructions that are set forth in the instruction manual and user manual for the Product and the caution label affixed to the Product
- (3) Even during the term of warranty, the repair cost will be charged on you in the following cases;
  - a failure caused by your improper storing or handling, carelessness or negligence, etc., and a failure caused by your hardware (i) or software problem
  - a failure caused by any alteration, etc. to the Product made on your side without our approval
  - a failure which may be regarded as avoidable, if your equipment in which the Product is incorporated is equipped with a safety (iii) device required by applicable laws and has any function or structure considered to be indispensable according to a common sense in the industry
  - a failure which may be regarded as avoidable if consumable parts designated in the instruction manual, etc. are duly (iv) maintained and replaced
  - any replacement of consumable parts (battery, fan, smoothing capacitor, etc.) (v)
  - a failure caused by external factors such as inevitable accidents, including without limitation fire and abnormal fluctuation of (vi) voltage, and acts of God, including without limitation earthquake, lightning and natural disasters
  - (vii) a failure generated by an unforeseeable cause with a scientific technology that was not available at the time of the shipment of (viii) any other failures which we are not responsible for or which you acknowledge we are not responsible for

#### 2. Term of warranty after the stop of production

- (1) We may accept the repair at charge for another seven (7) years after the production of the product is discontinued. The announcement of the stop of production for each model can be seen in our Sales and Service, etc.
- (2) Please note that the Product (including its spare parts) cannot be ordered after its stop of production.

#### 3. Service in overseas countries

Our regional FA Center in overseas countries will accept the repair work of the Product. However, the terms and conditions of the repair work may differ depending on each FA Center. Please ask your local FA center for details.

#### 4. Exclusion of responsibility for compensation against loss of opportunity, secondary loss, etc.

Whether under or after the term of warranty, we assume no responsibility for any damages arisen from causes for which we are not responsible, any losses of opportunity and/or profit incurred by you due to a failure of the Product, any damages, secondary damages or compensation for accidents arisen under a specific circumstance that are foreseen or unforeseen by our company, any damages to products other than the Product, and also compensation for any replacement work, readjustment, start-up test run of local machines and the Product and any other operations conducted by you.

#### 5. Change of Product specifications

Specifications listed in our catalogs, manuals or technical documents may be changed without notice.

#### 6. Application and use of the Product

- (1) For the use of our General-Purpose AC Servo, its applications should be those that may not result in a serious damage even if any failure or malfunction occurs in General-Purpose AC Servo, and a backup or fail-safe function should operate on an external system to General-Purpose AC Servo when any failure or malfunction occurs.
- (2) Our General-Purpose AC Servo is designed and manufactured as a general purpose product for use at general industries. Therefore, applications substantially influential on the public interest for such as atomic power plants and other power plants of electric power companies, and also which require a special quality assurance system, including applications for railway companies and government or public offices are not recommended, and we assume no responsibility for any failure caused by these applications when used

In addition, applications which may be substantially influential to human lives or properties for such as airlines, medical treatments, railway service, incineration and fuel systems, man-operated material handling equipment, entertainment machines, safety machines, etc. are not recommended, and we assume no responsibility for any failure caused by these applications when used. We will review the acceptability of the abovementioned applications, if you agree not to require a specific quality for a specific application. Please contact us for consultation.
